Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q43-Q48):

NEW QUESTION # 43
Which Portworx CRD object is used to set up essential parameters for a Portworx installation?

- A. VolumeSnapshot
- B. ServiceAccount
- C. StorageCluster

Answer: C

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
The StorageCluster Custom Resource Definition (CRD) is the central object used to configure and manage a Portworx installation on Kubernetes. It contains essential parameters including cluster-wide settings, KVDB configuration, storage pool definitions, security options, and CSI driver configurations. The StorageCluster resource declaratively defines how Portworx should be deployed, upgraded, and operated within the Kubernetes cluster. Administrators edit this object to adjust configurations, enabling features like telemetry, monitoring, and cloud integration. Unlike VolumeSnapshot (which manages snapshots) or ServiceAccount (which controls Kubernetes permissions), StorageCluster governs the overall lifecycle and parameters of the Portworx deployment. Portworx operator documentation identifies StorageCluster as the fundamental CRD for installation and configuration management【Pure Storage Portworx Operator Guide source】.

NEW QUESTION # 44
A cluster administrator wants to define an Autopilot rule for Portworx.
What are the 4 main parts of an Autopilot rule?

- A. Enforcement, Match Expressions, Topology Key and Weight
- B. Selector, Namespace Selector, Conditions and Actions
- C. Replica, I/O profile, Secure, Placement Strategy

Answer: B

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
An Autopilot rule in Portworx consists of four main parts: Selector, Namespace Selector, Conditions, and Actions. The Selector defines the set of volumes or pods the rule applies to, often using labels. Namespace Selector further narrows the scope to specific Kubernetes namespaces, allowing targeted policy application. Conditions specify triggers or thresholds such as capacity utilization, I/O metrics, or time-based schedules. When conditions are met, the Actions section defines automated responses such as volume expansion, migration, or alerting. This modular rule design enables flexible, policy-driven automation for storage management, helping maintain cluster health and performance without manual intervention. The Portworx Autopilot documentation provides detailed schema and examples, emphasizing these components as foundational for dynamic, autonomous cluster operation【Pure Storage Portworx Autopilot Guide source】.

NEW QUESTION # 45
What Portworx swap requirement exists on a Portworx-enabled Linux host?

- A. Swap should be enabled.

- B. Portworx does not have a requirement for swap to be enabled or disabled.
- C. Swap should be disabled.

Answer: C

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
Portworx requires swap to be disabled on Linux hosts where it runs. Disabling swap is necessary because swap usage can cause unpredictable latency and performance degradation for storage operations. Portworx relies on consistent and predictable I/O performance for managing block devices and volumes, which is incompatible with the potential delays caused by swapping memory pages to disk. Additionally, many Kubernetes environments recommend disabling swap to meet Kubernetes scheduler requirements, aligning with Portworx's needs. Portworx installation and system requirements documentation explicitly state that swap should be disabled on nodes running Portworx to ensure cluster stability, optimal performance, and predictable behavior of storage operations【Pure Storage Portworx System Requirements source】.

NEW QUESTION # 46

Which Portworx component is used to co-locate volumes with pods?

- A. Volume Placement Strategy
- B. Stork
- C. Autopilot

Answer: A

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
Portworx's Volume Placement Strategy ensures that persistent volumes are co-located with the pods that use them, enhancing performance and reducing latency. This strategy involves applying placement rules and constraints that guide Kubernetes scheduler and Portworx storage operations to place data volumes on nodes close to or the same as the pods. Co-location improves I/O throughput and application responsiveness by minimizing network hops between compute and storage resources. While Autopilot automates scaling and Stork manages storage-aware scheduling, Volume Placement Strategy specifically handles volume location relative to workloads. The Portworx architecture documentation highlights this component as critical for optimizing storage efficiency and workload performance in Kubernetes environments running Portworx storage【Pure Storage Portworx Architecture Docs source】.

NEW QUESTION # 47

What is the primary command used to back up a volume in Portworx?

- A. pxctl volume snapshot create
- B. pxctl backup volume
- C. pxctl volume save

Answer: A

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
The primary command to back up a volume in Portworx is pxctl volume snapshot create. This command creates a point-in-time snapshot of the specified volume, capturing its state for backup or recovery purposes. Snapshots can be local or uploaded to cloud object stores as part of disaster recovery strategies. The snapshot operation is efficient and minimally intrusive, using -on-write mechanisms to avoid full data duplication. Although other commands like pxctl volume save or pxctl backup volume might exist in other storage systems, Portworx explicitly uses pxctl volume snapshot create as its core volume backup command. The Portworx CLI documentation details this command as fundamental for data protection and snapshot lifecycle management in the cluster【Pure Storage Portworx CLI Guide source】.
