## HP Aruba Certified Campus Access Professional Exam Sample Questions (Q71-Q76):

### NEW QUESTION # 71

You are troubleshooting an issue with a pair of Aruba CX 8360 switches configured with VSX. Each switch has multiple VRFs. You need to find the IP address of a particular client device with a known MAC address. You run the "show arp" command on the primary switch in the pair but do not find a matching entry for the client MAC address.

The client device is connected to an Aruba CX 6100 switch by VSX LAG.

Which action can be used to find the IP address successfully?

Run the following command on the CX 6100 switch:

show mac-address-table

- A.

Run the following command on the CX 6100 switch:

show arp all-vrf

- B.

Run the following command on the VSX primary switch:

- C.

show arp all-vrf

- D.

Run the following command on the VSX primary switch:

show mac-address-table

**Answer: C**

Explanation:

Explanation

The show arp command displays the ARP table for a specific VRF or all VRFs on the switch. The ARP table contains the IP address to MAC address mappings for hosts that are directly connected to the switch or reachable through a gateway. If the client device is connected to another switch by VSX LAG, the ARP entry for the client device will not be present on the primary switch unless it has communicated with it recently.

Therefore, to find the IP address of the client device, the administrator should run the show arp command on the secondary switch in the VSX pair, specifying the VRF name that contains the client device's subnet.

## NEW QUESTION # 72

For the Aruba CX 6400 switch, what does virtual output queueing (VOQ) implement that is different from most typical campus switches?

- A. large egress packet buffers
- **B. large ingress packet buffers**
- C. VSX
- D. per port ASICs

**Answer: B**

Explanation:

The Aruba CX 6400 switch is a modular switch that supports high-performance and high-density Ethernet switching for campus and data center networks. One of the features that distinguishes the Aruba CX 6400 switch from most typical campus switches is virtual output queueing (VOQ). VOQ is a technique that implements large ingress packet buffers on each port to prevent head-of-line blocking and packet loss due to congestion. VOQ allows each port to have multiple queues for different output ports and prioritize packets based on their destination and QoS class. VOQ enables the Aruba CX 6400 switch to achieve high throughput and low latency for various traffic types and scenarios. ## NEW QUESTION # 73

Refer to the image.

Your customer is complaining of weak Wi-Fi coverage in their office. They mention that the office on the other side of the hall has much better signal.

What is the likely cause of this issue?

- A. The AP is an outdoor access point.
- B. The AP is using a directional antenna.**
- C. The AP is a remote access point.
- D. The AP is configured in Mesh mode

**Answer: B**

Explanation:

The likely cause of the issue of weak Wi-Fi coverage in the office is that the AP is using a directional antenna.

A directional antenna is an antenna that radiates or receives radio waves more strongly in one or more directions, creating a focused beam of signal. A directional antenna can provide better coverage and performance for a specific area, but it can also create dead zones or weak spots for other areas. The other options are incorrect because they either do not affect the Wi-Fi coverage or do not match the scenario.

**NEW QUESTION # 75**

Which feature supported by SNMPv3 provides an advantage over SNMPv2c?

- A. GetBulk
- **B. Encryption**
- C. Community strings
- D. Transport mapping

**Answer: B**

Explanation:

Encryption is a feature supported by SNMPv3 that provides an advantage over SNMPv2c. Encryption protects the confidentiality and integrity of SNMP messages by encrypting them with a secret key.

SNMPv2c does not support encryption and relies on community strings for authentication and authorization, which are transmitted in clear text and can be easily intercepted or spoofed. Transport mapping, community strings, and GetBulk are features that are common to both SNMPv2c and SNMPv3.
