CrowdStrike Certified Cloud Specialist Sample Questions (Q89-Q94):

NEW QUESTION # 89

An organization is deploying the CrowdStrike Falcon sensor on a Linux server to secure their Kubernetes workloads. Which of the following is a requirement for successfully installing the Falcon sensor on a Linux server?

- A. The Linux server must be running in a bare-metal environment, as virtual machines are not supported.
- B. The Linux server must run a kernel version that is supported by the Falcon sensor.
- C. The Linux server must have Docker installed as the only supported container runtime.
- D. The server must disable all other antivirus or endpoint security software before installation.

Answer: B

Explanation:

Option A: The Falcon sensor requires compatibility with specific Linux kernel versions. Running an unsupported kernel version can result in installation failure or incomplete functionality. This requirement ensures the sensor can operate effectively and perform its security functions.

Option B: This is incorrect because the Falcon sensor is container-runtime agnostic. While Docker is supported, the sensor also works with other container runtimes, such as containerd and CRI-O.

Option C: While it is recommended to ensure compatibility with other endpoint security tools, the Falcon sensor does not require other antivirus software to be disabled. It can often coexist with other tools depending on configuration.

Option D: This is incorrect because the Falcon sensor supports both bare-metal and virtualized environments. It is designed to operate in diverse infrastructure setups, including cloud-based virtual machines.

NEW QUESTION # 90

During the registration of a cloud account into the CrowdStrike Falcon platform, a user encounters an error message indicating "Insufficient permissions to access cloud resources." Which of the following actions should the user take to resolve the issue?

- A. Assign the CrowdStrike IAM role to the cloud account with all necessary permissions.
- B. Ensure that the cloud account is part of an active CrowdStrike subscription.
- C. Use the CrowdStrike service account credentials directly to bypass IAM role issues.
- D. Disable multi-factor authentication (MFA) for the cloud account temporarily.

Answer: A

Explanation:

Option A: While an active subscription is required for integration, it is unrelated to the permissions issue. A subscription mismatch would generate a different error message.

Option B: This is incorrect because MFA is unrelated to the permissions required for integration.

Disabling MFA would compromise security and would not address the root cause of insufficient permissions.

Option C: The most common cause of this error is that the necessary IAM role has not been properly assigned or lacks permissions to access the required cloud resources. The CrowdStrike documentation specifies the IAM policies required for integration, and ensuring these are correctly configured resolves the issue.

Option D: This is incorrect because CrowdStrike never recommends using service account credentials directly for security reasons. The integration relies on IAM roles for secure delegation of access.

NEW QUESTION # 91

In Falcon Cloud Security, how is the distinction between assessed and unassessed items most accurately explained?

- A. Assessed items refer to all managed assets, while unassessed items include only unmanaged assets.
- **B. Assessed items are container images that have been scanned for vulnerabilities, while unassessed items are those that have not yet been scanned.**
- C. Assessed items include containers that are in active use, while unassessed items include archived or inactive containers.
- D. Assessed items have been fully patched, while unassessed items have outdated configurations.

Answer: B

Explanation:

Option A: Assessed items are those, such as container images, that have undergone vulnerability or configuration assessments within Falcon Cloud Security. Unassessed items have not yet been scanned, possibly due to configuration, scope, or timing limitations. Understanding this distinction is critical for prioritizing security tasks.

Option B: The term "assessed" does not equate to being "fully patched." An item can be assessed and still have vulnerabilities that need remediation.

Option C: Assessed and unassessed statuses are not related to the activity or archival state of containers. Both active and inactive containers can be either assessed or unassessed depending on scanning processes.

Option D: Assessed items are not synonymous with managed assets; unmanaged items can also be assessed if scanned through external tools or workflows.

NEW QUESTION # 92

When creating an API client for cloud account integration in CrowdStrike Falcon, which of the following is a required step?

- A. Configure the API client to use legacy authentication methods
- B. Generate a public-private key pair and upload the private key to Falcon
- **C. Assign specific API scopes to limit the client's access**
- D. Grant the API client administrator privileges to all cloud accounts

Answer: C

Explanation:

Option A: This is incorrect because legacy authentication methods are less secure and not recommended.

CrowdStrike uses token-based authentication for API clients.

Option B: This is correct because assigning API scopes defines the level of access the API client has, ensuring the principle of least privilege is followed. For cloud account integration, API scopes like read, write, or view are tailored to the required tasks without over-provisioning access.

Option C: This is incorrect because granting administrator privileges violates security best practices. Over-provisioning access can increase the risk of accidental or malicious actions.

Option D: This is incorrect because CrowdStrike Falcon requires generating API keys within the platform rather than relying on external key-pair uploads.

NEW QUESTION # 93

What is the recommended method to block a specific CVE for 14 days when creating an Image assessment policy exclusion?

- **A. Vulnerability ID & Exclude until 14 days**
- B. Packages published recently until 14 days
- C. Vulnerable ID & Exclude indefinitely
- D. Vulnerabilities published recently until 14 days

Answer: A

Explanation:

When creating an Image Assessment policy exclusion in CrowdStrike Falcon Cloud Security, the recommended and most precise method to temporarily suppress a specific CVE is Vulnerability ID & Exclude until 14 days.

This approach allows security teams to explicitly reference a known CVE (for example, CVE-2024-XXXX) and suppress enforcement for a defined time window. The 14-day exclusion period is commonly used to allow development teams time to rebuild images, validate patches, or address dependency constraints without permanently weakening security posture.

Broad exclusions based on recently published vulnerabilities or packages can unintentionally suppress unrelated risk and increase exposure. Indefinite exclusions are discouraged unless there is a strong, documented business justification. CrowdStrike documentation and best practices emphasize time-bound, CVE-specific exclusions to balance operational flexibility with security rigor. Therefore, the correct and recommended option is Vulnerability ID & Exclude until 14 days.
