PTC-AMCA Exam Bootcamp & PTC-AMCA Latest Dumps & PTC-AMCA Study Materials

They check each Medical Technology PTC-AMCA practice test question and ensure the top standard of AMCA Phlebotomy Technician Certification Exam (PTC-AMCA) exam questions all the time. So you can trust PassLeaderVCE Medical Technology PTC-AMCA practice test questions and start Medical Technology PTC-AMCA exam preparation with confidence. The PassLeaderVCE is a leading platform committed to making entire AMCA Phlebotomy Technician Certification Exam (PTC-AMCA) exam preparation simple, quick, and easy for everyone. To fulfill this objective the PassLeaderVCE are offering top-rated and real AMCA Phlebotomy Technician Certification Exam (PTC-AMCA) practice test questions in three different formats.

Medical Technology AMCA Phlebotomy Technician Certification Exam Sample Questions (Q250-Q255):

NEW QUESTION # 250

A patient hospitalized for chemotherapy for renal cancer would most likely be treated in which department?

- A. Cardiology
- B. Endocrinology
- C. Oncology
- D. Hematology'

Answer: C

Explanation:

A patient hospitalized for chemotherapy for renal (kidney) cancer would most likely be treated in the oncology (cancer) department. The oncology department specializes in administration of chemotherapy, radiation, and other therapies for the treatment of all types of cancers. Hematology is the specialty that diagnoses and treats diseases of the blood. Endocrinology is the specialty related to endocrine glands and hormones. Cardiology is the branch of medicine that focuses on the heart.

NEW QUESTION # 251

A patient with an order for blood tests has a clamped PICC line in the left arm, so the phlebotomist should draw blood from the:

- A. Left arm, distal to the PICC line
- B. Left arm, proximal to the PICC line
- C. PICC line
- D. Right arm

Answer: D

Explanation:

A patient with an order for blood tests has a clamped peripherally inserted central catheter (PICC) line in the left arm, so the phlebotomist should draw blood from the right arm. Drawing blood from a vascular access device, such as a PICC line, is outside of the scope of practice of the phlebotomist; however, the phlebotomist may provide necessary collection tubes to a nurse or physician who accesses the PICC line and may transport the tubes. If a PICC line is in one arm, the opposite arm should be used for venipuncture if possible.

NEW QUESTION # 252

A vital function of the capillaries is to:

- A. Stabilize the blood pressure.
- **B. Exchange gases, nutrients, and metabolic by-products.**
- C. Secrete substances that prevent the clotting of blood.
- D. Control the flow of blood.

Answer: B

Explanation:

A vital function of the capillaries is to exchange gases (carbon dioxide [CO₂] for oxygen), nutrients, and metabolic by-products (wastes). Capillaries are extensions of arteriole endothelium and are tiny, thin-walled vessels that carry a mixture of arterial and venous blood. The walls of the capillaries are semipermeable, with tiny openings where endothelial cells in the walls overlap. The density of capillary networks depends on the metabolism of the tissue, so capillaries are dense in muscle and nerve tissue and are less dense in cartilage, the epidermis, and the corneas.

NEW QUESTION # 253

A urine sample is considered acidic if its pH is:

- A. Less than 4.5
- B. Greater than 8
- C. Greater than 7
- **D. Less than 7**

Answer: D

Explanation:

All aqueous (water-based) solutions have a pH, which is the negative logarithm of the concentration of hydrogen ions. The solution is considered acidic at a pH of less than 7 and alkaline (or basic) at a pH of greater than 7. Because urine is a water-based solution, the same definitions apply. Urine is therefore considered acidic if its pH is less than 7. Urine is typically acidic, but can also be alkaline; the normal pH range for urine is 4.5-8.

NEW QUESTION # 254

Which of the following tests should be available on a POC ABG analyzer?

- A. Hct
- B. Na
- C. Hgb
- **D. PCO₂**

Answer: D

Explanation:

The tests that are typically available on a point-of-care (POC) arterial blood gas (ABG) analyzer include the following:

- pH: acidity/alkalinity
- TCO₂: total carbon dioxide, including intermediate forms
- PO₂: partial pressure of dissolved oxygen in the blood
- PCO₂: partial pressure of dissolved carbon dioxide in the blood
- SO₂: percentage of hemoglobin-binding sites in the blood occupied by oxygen
- HCO₃: concentration of hydrogen carbonate (a by-product of metabolism) in the blood
- Base excess/deficit: excess with metabolic alkalosis and deficit with metabolic acidosis

NEW QUESTION # 255

.....

This way you will get familiar with AMCA Phlebotomy Technician Certification Exam exam pattern and objectives. No additional plugins and software installation are indispensable to access this PTC-AMCA Practice Test. Furthermore, all browsers and operating systems support this version of the Medical Technology PTC-AMCA practice exam.
