## Valid CIS-PA Valid Exam Vce Free offer you accurate New Exam Duration | ServiceNow Certified Implementation Specialist - Platform Analytics

Obtaining a CIS-PA certificate can prove your ability so that you can enhance your market value. However, it is well known that obtaining such a CIS-PA certificate is very difficult for most people, especially for those who always think that their time is not

enough to learn efficiently. However, our CIS-PA test prep take full account of your problems and provide you with reliable services and help you learn and improve your ability and solve your problems effectively. Once you choose our CIS-PA Quiz guide, you have chosen the path to success. We are confident and able to help you realize your dream. A higher social status and higher wages will not be illusory.

## ServiceNow Certified Implementation Specialist - Platform Analytics Sample Questions (Q35-Q40):

### NEW QUESTION # 35

An Indicator stores the value 7423.3.

If the Precision is set to 0, what is displayed in a Score widget?

- A. 0
- **B. 7k**
- C. 7423.3
- D. 1

**Answer: B**

Explanation:

In ServiceNow Platform Analytics, the Precision setting controls how numeric values are rounded and abbreviated when displayed in Score widgets. When Precision is set to 0, the platform displays values using compact notation (such as k for thousands or M for millions) with no decimal places.

For a stored value of 7423.3, Precision 0 causes the value to be rounded to the nearest thousand and displayed as 7k. Platform Analytics does not display the full raw number unless compact notation is disabled or precision is increased. Option B (7000) and option D (7423) represent numeric rounding but not the compact display format used by score widgets. Option C is incorrect because Precision 0 explicitly removes decimals and applies abbreviation.

ServiceNow documentation confirms that score widgets use precision-based compact formatting, making 7k the correct displayed value when Precision is set to 0.

### NEW QUESTION # 36

Which type of Indicator allows enabling Show real-time score?

- A. Formula Indicator
- **B. Non-scripted Automated Indicator**
- C. Scripted Automated Indicator
- D. Manual Indicator

**Answer: B**

Explanation:

The Show real-time score option is available only for non-scripted Automated Indicators. These indicators are based on standard indicator sources and conditions that can be safely recalculated on demand without scripting complexity.

Scripted automated indicators and formula indicators depend on stored historical values and custom logic, which cannot be reliably recalculated in real time. Manual indicators rely on user-entered values and also do not support real-time calculation. ServiceNow documentation explicitly limits real-time scoring to non-scripted automated indicators to preserve performance and data integrity. Therefore, option D is the correct answer.

### NEW QUESTION # 37

A filtered Time Series widget shows individual trends for the number of open incidents with High and Critical priorities.

Which action configures the Responsive Canvas Dashboard to show a combined trend for the Critical and High-priority incidents?

- A. Apply an elements filter to return High and Critical incidents only
- B. Check Manual elements and add widget elements for the High and Critical incidents
- **C. Set the Show multiple elements as property to Aggregate**
- D. Set the Show multiple elements as property to Separate

**Answer: C**

Explanation:

In Responsive Canvas dashboards, when a Time Series widget contains multiple elements, the `Show multiple elements as property` controls how those elements are visualized. Setting this property to `Aggregate` combines the values of all returned elements into a single trend line, which is exactly the desired outcome when viewing a combined trend for High and Critical priority incidents.

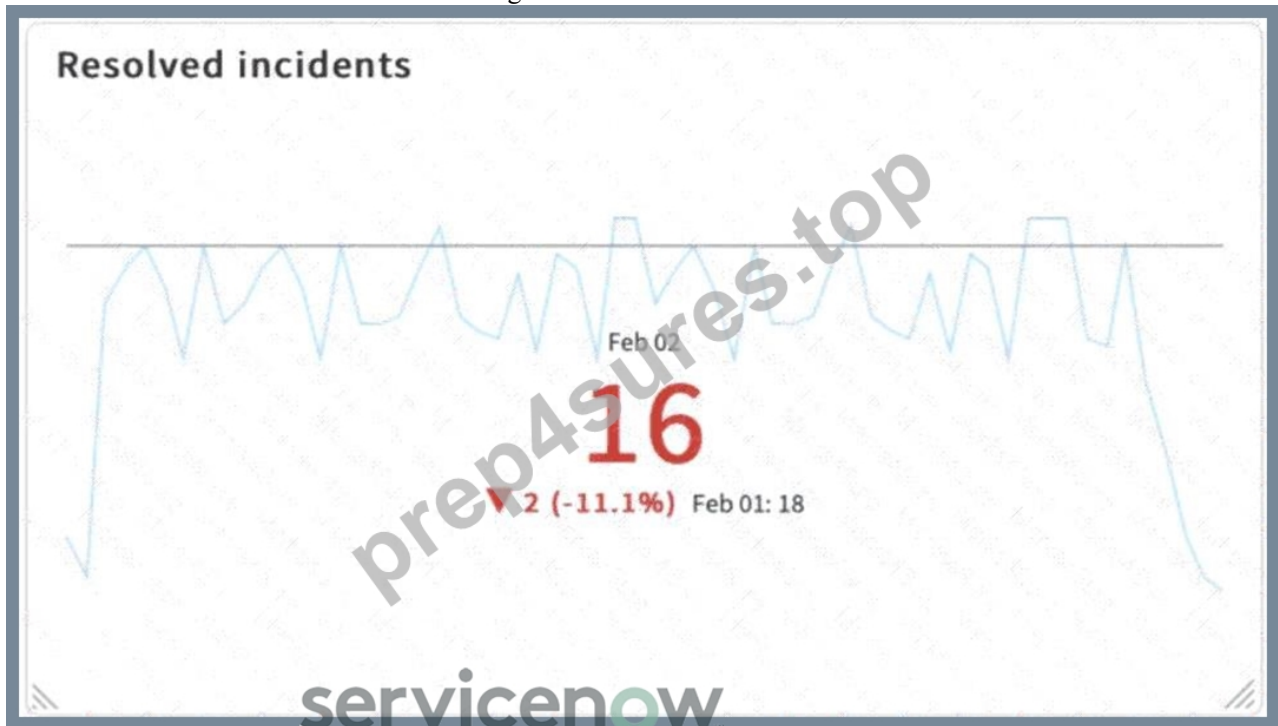

Applying an elements filter (option D) limits which elements are displayed but does not combine them into one trend. Setting the property to `Separate` (option C) explicitly shows individual trend lines for each element.

Manually adding elements (option B) still results in multiple distinct series unless aggregation is enabled.

According to ServiceNow Platform Analytics documentation, aggregation is the correct method for consolidating multiple indicator elements into one unified visualization on a dashboard.

### NEW QUESTION # 38

What determines the color of the score in a Score widget?

- A. Relationship to the target and the Direction setting of the Indicator
- B. Field styles on the field used to calculate the Indicator
- C. Chart color defined for the base table
- D. Widget settings

**Answer: A**

Explanation:

In ServiceNow Platform Analytics, the color of the score displayed in a Score widget is determined by the Indicator's relationship to its target in combination with the `Direction` setting (`Maximize` or `Minimize`) of the Indicator. This behavior is part of the KPI evaluation logic and is consistent across dashboards and KPI Details.

When an indicator has a defined target, Platform Analytics compares the current score against that target.

Based on whether the indicator is configured to `maximize` (higher is better) or `minimize` (lower is better), the platform automatically assigns a visual status—such as green (on track), yellow (warning), or red (off track).

This status directly controls the color of the score values shown in the widget.

Chart colors, field styles, or widget-specific settings do not influence the score color. Those options may affect line charts or visual styling, but not KPI status coloring. ServiceNow documentation clearly states that KPI status and score coloring are driven by target evaluation logic, making option A the correct and verified answer.

### NEW QUESTION # 39

Breakdown element security is configured in the properties of which object?

- A. Manual Breakdown

- B. Breakdown Source
- **C. Automated Breakdown**
- D. Automated Indicator

**Answer: C**

Explanation:

Breakdown element security determines which users are allowed to see specific breakdown elements (such as certain categories or values) when viewing analytics data. In Platform Analytics, this security is configured directly on the Automated Breakdown record. Automated Breakdowns include properties that allow administrators to define element-level access control, typically by specifying roles that are required to view certain breakdown elements. This ensures sensitive analytics data is only visible to authorized users. The Breakdown Source defines how data is mapped and categorized but does not control visibility. Automated Indicators control score collection and aggregation, not breakdown element security. Manual Breakdowns are static and do not support dynamic element security in the same way.

ServiceNow documentation explicitly states that breakdown element security settings—such as restricting elements by role—are part of the Automated Breakdown configuration, making option D the correct answer.

## NEW QUESTION # 40

.....

The meaning of qualifying examinations is, in some ways, to prove the candidate's ability to obtain CIS-PA qualifications that show your ability in various fields of expertise. If you choose our CIS-PA learning guide materials, you can create more unlimited value in the limited study time, learn more knowledge, and take the exam that you can take. Through qualifying CIS-PA examinations, this is our CIS-PA real questions and the common goal of every user, we are trustworthy helpers, so please don't miss such a good opportunity.
