최신 ISTQB Foundation Level CTFL_Syll_4.0 무료샘플문제 (Q178-Q183):

질문 # 178

Which of the following statements is an example of testing contributing to higher quality?

- A. A project manager asks to a test leader to estimate the test effort
- B. A tester installs a test ten in the test environment
- **C. A tester finds a bug which is resolved prior to release**
- D. A test leader writes a test summary report

정답: C

설명:

* The question is about identifying an example of testing contributing to higher quality. Quality is the degree to which a component, system or process meets specified requirements and/or user/customer needs and expectations¹. Testing is the process consisting of all lifecycle activities, both static and dynamic, concerned with planning, preparation and evaluation of software products and related work products to determine that they satisfy specified requirements, to demonstrate that they are fit for purpose and to detect defects².

* Therefore, testing contributes to higher quality by verifying and validating that the software products and related work products meet the specified requirements, are fit for purpose and have no defects, or at least have a reduced number of defects. Testing also provides information about the quality of the software products and related work products to the stakeholders, who can make informed decisions based on the test results³.

* Out of the four given statements, only option D is an example of testing contributing to higher quality, as it shows that testing has detected a defect (a flaw in a component or system that can cause the component or system to fail to perform its required function⁴) and that the defect has been resolved (fixed and confirmed) prior to release (delivery of the software product to the customer or end user).

This means that testing has prevented a potential failure (an event in which a component or system does not perform a required function within specified limits) from occurring in the operational environment, and thus has improved the quality of the software product.

* Option A is not an example of testing contributing to higher quality, as it is a reporting activity that summarizes the test results and evaluates the test objectives, but does not directly affect the quality of the software product or related work products. A test summary report is a document that records and communicates the outcomes of testing activities, including test completion criteria, test results, incident reports, test summary and evaluation, and lessons learned.

* Option B is not an example of testing contributing to higher quality, as it is a planning activity that estimates the resources and time needed for testing activities, but does not directly affect the quality of the software product or related work products. A test effort estimate is an approximation of the amount of work and/or the duration of time required to perform testing activities.

* Option C is not an example of testing contributing to higher quality, as it is a preparation activity that sets up the test environment (an environment containing hardware, instrumentation, simulators, software tools, and other support elements needed to conduct a test), but does not directly affect the quality of the software product or related work products. A test environment installation is a process of installing and configuring the test environment according to the test environment specification.

질문 # 179

Which ONE of the following statements is correct?

- A. Test cases can be tested using static testing techniques but not the models
- B. Difficult to interpret work products are best tested using static analysis.
- C. There may be legal issues in performing static testing on a commercially available executable library.
- D. Static analysis can be used against a work product containing unstructured artifacts

정답: C

설명:

Performing static testing on a commercially available executable library can raise legal issues, primarily related to the ownership and licensing of the software. These libraries are often proprietary, and analyzing them without permission may violate software licenses or intellectual property laws. Static testing typically involves analyzing source code, which may not be accessible for such libraries without appropriate permissions.

질문 # 180

Which ONE of the following statements would you expect to be the MOST DIRECT advantage of the whole- team approach?

- A. Avoiding requirements misunderstandings that may not have been detected until dynamic testing when they are more expensive to fix.
- B. Having an automated build and test process, at least once a day, that detects integration errors early and quickly.
- C. Reducing the involvement of business representatives because of enhanced communication and collaboration between testers and developers.
- D. Capitalizing on the combined skills of business representatives, testers, and developers working together to contribute to project success.

정답: D

설명:

The whole-team approach promotes collaboration among stakeholders (business representatives, developers, and testers) to ensure better quality and project success (A). This approach allows for early identification of issues, enhances shared responsibility, and improves software quality. Option C is a valid but indirect benefit, while options B and D do not directly describe the core advantage of the whole-team approach.

질문 # 181

Which of the following statements describes regression testing?

I) Retesting of a fixed defect

- II) Testing of an already tested program
- III) Testing of new functionality in a program
- IV) Regression testing applies only to functional testing
- V) Tests that do not have to be repeatable, because they are only used once

- A. I, III, IV
- B. II, IV, V
- C. I, IV
- D. II

정답: D

설명:

Regression testing is the re-running of functional and non-functional tests to ensure that previously developed and tested software still performs as expected after a change¹. It does not involve retesting of a fixed defect, testing of new functionality, or applying only to functional testing. Tests that are used for regression testing should be repeatable, because they are used to verify the stability of the software after each change². 질문 # 182

Your organization's test strategy states that it is desirable to use more than one method for estimating test effort. You are responsible for estimating test effort for the next project. Based on historical data, the development-to-test effort ratio is 5:3.

The initial estimate for the development effort is 450 person-days.

Which ONE of the following options corresponds to the estimated test effort using the ratio-based method?

- A. 720 person-days
- B. 750 person-days
- C. 180 person-days
- D. 270 person-days

정답: D

설명:

The ratio-based estimation method relies on historical relationships between development and testing effort.

Using the given 5:3 ratio:

$$\text{Test Effort} = \left(\frac{3}{5} \times \text{Development Effort} \right) = \left(\frac{3}{5} \times 450 \right) = 270 \text{ person-days}$$

Thus, the correct answer is 270 person-days (D).

* (A) and (C) are incorrect as they overestimate the effort.

* (B) underestimates the testing effort based on the ratio.

Ratio-based estimation helps allocate resources effectively based on past project data.
