NEW QUESTION # 120

The automation engineer must replace device configuration using RESTCONF. How is this configured using the Python library Requests?

- A. post()
- B. patch()
- C. put()
- D. delete()

Answer: C

NEW QUESTION # 121

Refer to the exhibit.

```
- name: Create VRFs as defined by local_vrfs
  ios_vrf:
    vrfs: "{{ local_vrfs }}"
    state: 
    register: addvrf
```

An engineer creates an Ansible playbook to configure VRF information using a local_vrfs variable. The code must be completed so that it can be tested. Which string completes the code?

- A. active
- B. up
- C. present
- D. on

Answer: C

Explanation:

In Ansible, the state parameter is used to define the desired state of a resource on the remote device. The options typically include "present" or "absent," indicating whether the resource should exist or not. In this context, "present" is used to ensure that the VRFs defined in the local_vrfs variable are configured on the target device. Therefore, the string that completes the code for configuring VRF information using a local_vrfs variable is "present." References: = Automating Cisco Enterprise Solutions Official Cert Guide
