

AWS-Solutions-Architect-Professional 높은 통과율 공부문제, AWS-Solutions-Architect-Professional 최신 시험덤프 공부자료

2026 KoreaDumps 최신 AWS-Solutions-Architect-Professional PDF 버전 시험 문제집과 AWS-Solutions-Architect-Professional 시험 문제 및 답변 무료 공유: <https://drive.google.com/open?id=1SA-RBZfEvZDvuswnXIz1f6sDws6EQ4qM>

Amazon인증 AWS-Solutions-Architect-Professional 시험을 가장 빠른 시일내에 가장 쉬운 방법으로 패스하는 방법을 고 심초사한 끝에 KoreaDumps에서 연구해 내었습니다. 그건 바로 KoreaDumps의 Amazon인증 AWS-Solutions-Architect-Professional 덤프로 Amazon인증 AWS-Solutions-Architect-Professional 시험에 대비하는 것입니다. KoreaDumps의 Amazon인증 AWS-Solutions-Architect-Professional 덤프 품질을 검증하려면 구매사이트의 무료 샘플을 체험해보시면 됩니다. 자격증을 많이 취득하여 멋진 IT 전문가로 되세요.

시험을 준비하기 위해 응시자는 AWS Certified Solutions Architect -Professional Exam Guide를 검토하여 시험 목표 및 권장 연구 자원에 대한 자세한 개요를 제공합니다. 또한 AWS는 다양한 교육 과정, 실습 시험 및 기타 리소스를 제공하여 응시자가 시험 준비를 하고 성공하는 데 필요한 지식과 기술을 얻도록 도와줍니다.

시험패스 가능한 AWS-Solutions-Architect-Professional 높은 통과율 공부문제 덤프데모문제

Amazon인증 AWS-Solutions-Architect-Professional 시험을 한방에 편하게 통과하여 자격증을 취득하려면 시험전 공부 가이드가 필수입니다. KoreaDumps에서 연구제작한 Amazon인증 AWS-Solutions-Architect-Professional 덤프는 Amazon인증 AWS-Solutions-Architect-Professional 시험을 패스하는데 가장 좋은 시험준비 공부자료입니다. KoreaDumps 덤프 공부자료는 엘리트한 IT 전문가들이 자신의 노하우와 경험으로 최선을 다해 연구제작한 결과물입니다. IT인증 자격증을 취득하려는 분들의 곁은 KoreaDumps가 지켜드립니다.

최신 AWS Certified Solutions Architect AWS-Solutions-Architect-Professional 무료 샘플문제 (Q127-Q132):

질문 # 127

A company is migrating a three-tier application to AWS. The application requires a MySQL database. In the past, the application users reported poor application performance when creating new entries. These performance issues were caused by users generating different real-time reports from the application during working hours.

Which solution will improve the performance of the application when it is moved to AWS?

- A. Create the database on a compute optimized Amazon EC2 instance. Ensure compute resources exceed the on-premises database.

- B. Create an Amazon Aurora MySQL Multi-AZ DB cluster. Configure the application to use the backup instance of the cluster as an endpoint for the reports.
- C. Import the data into an Amazon DynamoDB table with provisioned capacity. Refactor the application to use DynamoDB for reports.
- **D. Create an Amazon Aurora MySQL Multi-AZ DB cluster with multiple read replicas. Configure the application reader endpoint for reports.**

정답: D

설명:

Explanation

질문 # 128

A Solutions Architect is responsible for redesigning a legacy Java application to improve its availability, data durability, and scalability. Currently, the application runs on a single high-memory Amazon EC2 instance. It accepts HTTP requests from upstream clients, adds them to an in-memory queue, and responds with a 200 status. A separate application thread reads items from the queue, processes them, and persists the results to an Amazon RDS MySQL instance. The processing time for each item takes 90 seconds on average., most of which is spent waiting on external service calls, but the application is written to process multiple items in parallel.

Traffic to this service is unpredictable. During periods of high load, items may sit in the internal queue for over an hour while the application processes the backlog. In addition, the current system has issues with availability and data if the single application node fails.

Clients that access this service cannot be modified. They expect to receive a response to each HTTP request they send within 10 seconds before they will time out and retry the request.

Which approach would improve the availability and durability of the system while decreasing the processing latency and minimizing costs?

- A. Create an Amazon API Gateway REST API that uses a service proxy to put items in an Amazon SQS queue. Extract the core processing code from the existing application and update it to pull items from Amazon SQS queue. Extract the core processing code from the existing application and update it to pull items from Amazon SQS instead of an in-memory queue. Deploy the new processing application to smaller EC2 instances within an Auto Scaling group that scales dynamically based on the approximate number of messages in the Amazon SQS queue.
- B. Update the application to use a Redis task queue instead of the in-memory queue. Build a Docker container image for the application. Create an Amazon ECS task definition that includes the application container and a separate container to host Redis. Deploy the new task definition as an ECS service using AWS Fargate and enable Auto Scaling.
- **C. Modify the application to use Amazon DynamoDB instead of Amazon RDS. Configure Auto Scaling for the DynamoDB table. Deploy the application within an Auto Scaling group with a scaling policy based on CPU utilization. Back the in-memory queue with a memory-mapped file to an instance store volume and periodically write that file to Amazon S3.**
- D. Create an Amazon API Gateway REST API that uses Lambda proxy integration to pass requests to an AWS Lambda function. Migrate the core processing code to a Lambda function and write a wrapper class that provides a handler method that converts the proxy events to the internal application data model and invokes the processing module.

정답: C

질문 # 129

By default, Amazon Cognito maintains the last-written version of the data.

You can override this behavior and resolve data conflicts programmatically.

In addition, push synchronization allows you to use Amazon Cognito to send a silent _____ notification to all devices associated with an identity to notify them that new data is available.

- A. pull
- B. get
- C. post
- **D. push**

정답: D

설명:

질문 # 130

A company is planning to migrate 1,000 on-premises servers to AWS. The servers run on several VMware clusters in the company's data center. As part of the migration plan, the company wants to gather server metrics such as CPU details, RAM usage, operating system information, and running processes. The company then wants to query and analyze the data. Which solution will meet these requirements?

- A. Export only the VM performance information from the on-premises hosts. Directly import the required data into AWS Migration Hub. Update any missing information in Migration Hub. Query the data by using Amazon QuickSight.
- B. Deploy the AWS Application Discovery Agent to each on-premises server. Configure Data Exploration in AWS Migration Hub. Use Amazon Athena to run predefined queries against the data in Amazon S3.
- C. Deploy and configure the AWS Agentless Discovery Connector virtual appliance on the on-premises hosts. Configure Data Exploration in AWS Migration Hub. Use AWS Glue to perform an ETL job against the data. Query the data by using Amazon S3 Select.
- D. Create a script to automatically gather the server information from the on-premises hosts. Use the AWS CLI to run the put-resource-attributes command to store the detailed server data in AWS Migration Hub. Query the data directly in the Migration Hub console.

정답: C

설명:

Explanation

The Agentless Discovery Connector is a virtual appliance that can be deployed on-premises to automatically discover the servers, applications, and network infrastructure in the data center. It can collect server metrics such as CPU details, RAM usage, operating system information, and running processes. The data collected can then be used in AWS Migration Hub to track the migration progress and identify dependencies.

AWS Glue can be used to perform an ETL job on the data collected by the Agentless Discovery Connector to prepare the data for analysis. The data can then be stored in Amazon S3 and queried using Amazon S3 Select, which allows you to retrieve specific data from a S3 object.

AWS Migration Hub provides a centralized place to track and monitor the progress of an application migration. The service allow you to track on-premises and cloud-based resources, and it provides a holistic view of your migration progress.

질문 # 131

An application running in a private subnet accesses an Amazon DynamoDB table. There is a security requirement that the data never leave the AWS network.

How should this requirement be met?

- A. Configure a network ACL on DynamoDB to limit traffic to the private subnet
- B. Add a NAT gateway and configure the route table on the private subnet
- C. Create a VPC endpoint for DynamoDB and configure the endpoint policy
- D. Enable DynamoDB encryption at rest using an AWS KMS key

정답: B
