

Trustworthy Managing-Cloud-Security Source - Exam Managing-Cloud-Security Bible

Managing Cloud Security - C838 Exam with Complete Answers

Broad network access - Answer-There should never be network bandwidth bottlenecks.

On-demand services - Answer-Refers to the model that allows customers to scale their compute and/or storage needs with little or no intervention from or prior communication with the provider.

Resource pooling - Answer-Characteristic that allows the cloud provider to meet various demands from customers while remaining financially viable.

measured/metered service - Answer-The customer is charged for only what they use and nothing more.

Business Impact Analysis (BIA) - Answer-An assessment of the priorities given to each asset and process within the organization

personally identifiable information (PII) - Answer-Under current laws, no cloud customer can transfer risk or liability associated with the inadvertent or malicious disclosure of <blank>.

Elasticity - Answer-This is the flexibility of allocating resources as needed for immediate usage, instead of purchasing resources according to other variables.

Simplicity - Answer-Usage and administration of cloud services ought to be transparent to cloud customers and users; from their perspective, a digital data service is paid for and can be used, with very little additional input other than what is necessary to perform their duties.

Scalability - Answer-The organization's computing needs won't remain static; there will be new (and hopefully more) users, customers, and data as the organization continually matures.

Infrastructure as a Service (IaaS) - Answer-The most basic of cloud service offerings, <blank> allows the customer to install all software, including operating systems (OSs) on hardware housed and connected by the cloud vendor.

Platform as a Service (PaaS) - Answer-<Blank> contains everything included in IaaS, with the addition of OSs.

Software as a Service (SaaS) - Answer-The cloud vendor becomes responsible for administering, patching, and updating software as well.

If you have any questions on our Managing-Cloud-Security exam question, you can just contact us for help. Even if it is a technical problem, our professional specialists will provide you with one-on-one services to help you solve it in the first time. And our Managing-Cloud-Security learning materials are really cost-effective in this respect. We always believe that customer satisfaction is the most important. And we always put the considerations of the customers as the most important matters. Our Managing-Cloud-Security Study Guide won't let you down.

No matter where you are or what you are, Managing-Cloud-Security practice questions promises to never use your information for commercial purposes. If you attach great importance to the protection of personal information and want to choose a very high security product, Managing-Cloud-Security Real Exam is definitely your first choice. And we always have a very high hit rate on the Managing-Cloud-Security study guide by our customers for our high pass rate is high as 98% to 100%.

>> Trustworthy Managing-Cloud-Security Source <<

**Exam Managing-Cloud-Security Bible & Managing-Cloud-Security
Reasonable Exam Price**

As long as you have a will, you still have the chance to change. Once you are determined to learn our Managing-Cloud-Security study materials, you will become positive and take your life seriously. Through the preparation of the Managing-Cloud-Security exam, you will study much practical knowledge. Of course, passing the exam and get the Managing-Cloud-Security certificate is just a piece of cake. With the high pass rate of our Managing-Cloud-Security practice braindumps as 98% to 100%, i can say that your success is guaranteed.

WGU Managing Cloud Security (JY02) Sample Questions (Q106-Q111):

NEW QUESTION # 106

Which risk mitigation technique will compensate a cloud service customer for failures on the part of the cloud service provider?

- A. Data protection requirements
- **B. SLA penalties**
- C. Recovery time objective
- D. Suspension of service clause

Answer: B

Explanation:

Service level agreement (SLA) penalties are a risk mitigation technique that compensates customers for failures by the cloud service provider. Managing Cloud principles explain that SLAs define performance commitments such as availability, response time, and reliability.

When a provider fails to meet these commitments, SLA penalties-often in the form of service credits or financial compensation-are applied. While penalties do not prevent failures, they provide accountability and partial financial remediation.

Recovery time objectives define recovery goals, data protection requirements address security controls, and suspension clauses govern service termination. None of these compensate customers directly. Therefore, SLA penalties are the correct mitigation technique.

NEW QUESTION # 107

An organization designing a data center wants the ability to quickly create and shut down virtual systems based on demand. Which concept describes this capability?

- A. Maintenance mode
- B. Resource scheduling
- **C. Ephemeral computing**
- D. High availability

Answer: C

Explanation:

The capability to rapidly create and destroy virtual systems as demand fluctuates is known as ephemeral computing. These short-lived resources are provisioned automatically when needed and decommissioned when demand subsides.

Resource scheduling helps allocate resources but does not imply temporary lifespans. High availability ensures continuous service, and maintenance mode is used for administrative tasks.

Ephemeral computing is central to elasticity in cloud environments, reducing costs and improving scalability.

For example, containers or serverless functions may run only while needed and then disappear. This model optimizes utilization, lowers expenses, and supports modern application architectures that demand agility.

NEW QUESTION # 108

Which factor should be the basis of a business continuity plan?

- A. Customers
- **B. Risks**
- C. Locations
- D. Costs

Answer: B

Explanation:

Risk is the foundational factor upon which a business continuity plan (BCP) should be based. Managing Cloud principles explain that BCP development begins with identifying and analyzing risks that could disrupt critical business operations.

Risk assessment evaluates threats, vulnerabilities, and potential impacts, allowing organizations to prioritize resources and define recovery strategies. By focusing on risk, organizations ensure that continuity planning addresses the most significant threats to operations, data, and services.

Costs, customers, and locations are important considerations but are secondary to risk analysis. Therefore, risks form the correct basis for a business continuity plan.

NEW QUESTION # 109

Which security information and event management concept focuses on account and service hijacking issues?

- A. Digital forensics
- B. Lightweight Directory Access Protocol
- C. Trust
- **D. Access control**

Answer: D

Explanation:

Access control is the SIEM-related concept that focuses on preventing and detecting account and service hijacking. Managing Cloud guidance explains that access control mechanisms define who can access systems, services, and data, and under what conditions.

SIEM solutions monitor access control events such as failed logins, privilege escalation, and abnormal authentication patterns. By analyzing these events, organizations can detect compromised accounts, stolen credentials, or unauthorized service access.

Digital forensics occurs after an incident, trust is a conceptual principle, and LDAP is a directory protocol rather than a SIEM focus area. Therefore, access control is the correct answer.

NEW QUESTION # 110

An engineer needs to create segmentation using the built-in tools provided by the company's cloud provider.

The InfoSec team has given the engineer directions to limit traffic using a security group between two cloud deployments in the organization. Which mechanisms should the engineer use to create this segmentation?

- A. Unique identifiers and protocols
- B. Definitions and protocols
- C. MAC addresses and protocols
- **D. Ports and protocols**

Answer: D

Explanation:

Cloud security groups typically filter traffic based on ports and protocols. By allowing or denying specific port/protocol combinations, engineers can control communication between deployments. For example, permitting HTTPS (TCP port 443) while blocking other ports enforces segmentation.

MAC addresses are not used in cloud-level segmentation because they apply to physical networks. Unique identifiers and definitions are not practical mechanisms for traffic filtering.

Using ports and protocols aligns with the principle of least privilege by ensuring that only necessary communication pathways exist.

In multi-deployment or hybrid cloud setups, this reduces the attack surface and prevents lateral movement by malicious actors.

Security groups thereby provide logical network segmentation without requiring physical infrastructure changes.

NEW QUESTION # 111

.....

Certainly you have heard of ExamPrepAway WGU Managing-Cloud-Security Dumps. But have you tried it? We often hear this, "ExamPrepAway questions and answers are really good reference materials, thanks to the dumps, I pass my exam successfully." ExamPrepAway has been favourably commented by the people who used its questions and answers. This is because it can really help students to save a lot of time, and ensure that everyone pass the exam successfully.
