VMware Advanced VMware Cloud Foundation 9.0 vSphere Kubernetes Service Sample Questions (Q83-Q88):

NEW QUESTION # 83

Which of the following best describes the primary function of a vSphere Namespace within a vSphere with Tanzu environment?

- A. It is a networking construct that provides isolation at Layer 2 for TKG clusters.
- **B. It is a resource boundary backed by a Resource Pool that allows vSphere administrators to set limits on CPU, memory, and storage for a set of Kubernetes workloads.**
- C. It is a logical boundary that encapsulates a set of virtual machines for resource management.
- D. It is a construct that maps 1:1 to a vCenter Server cluster for high availability.

Answer: B

NEW QUESTION # 84

A VKS Administrator is troubleshooting a TKG cluster provisioned with the name analytics-cluster. The provisioning process has stalled.

The administrator runs `kubectl get tanzukubernetescluster analytics-cluster -n data-science -o yaml` and observes the following status condition:

status:

conditions:

- lastTransitionTime: "2023-11-15T08:00:00Z"

message: "1 of 3 control plane VMs are ready. 0 of 5 worker VMs are ready. Storage Policy 'fast-ssd' not found." reason:

StoragePolicyUnsatisfied status: "False" type: Ready phase: Provisioning Based on this output, what is the root cause of the stalling and how should it be resolved? (Choose 2.)

- A. The storage policy fast-ssd is defined in the Cluster YAML but has not been assigned to the vSphere Namespace data-science.
- B. The Storage Policy fast-ssd does not exist in vCenter Server.
- C. The Control Plane VMs are failing to boot because of insufficient CPU resources in the Resource Pool.
- D. The solution is to add the fast-ssd storage policy to the data-science Namespace service in the vSphere Client.
- E. The solution is to delete the TKG cluster and recreate it using a different storage policy name like default-storage.

Answer: A,D

NEW QUESTION # 85

A Security Architect is designing a content distribution strategy for an air-gapped environment consisting of three distinct vCenter Server instances (Sites A, B, and C). Site A has a secure, one-way link to download images, but Sites B and C are completely isolated from the internet.

Requirement: All sites must use the exact same validated set of Tanzu Kubernetes Releases (TKRs).

What is the most efficient and consistent architectural design to manage the Content Libraries? (Select all that apply.)

- A. Configure Site A to subscribe directly to the public VMware registry, then publish that library to B and
- B. Manually create Local Libraries at Site B and Site C and upload the images separately to each site via USB drive to ensure air-gap integrity.
- C. Create a Local Content Library at Site A and manually upload the TKR OVAs downloaded from the VMware portal.
- D. Create Subscribed Content Libraries at Sites B and C, subscribing to the published URL of the Site A library (assuming internal routing exists between sites).
- E. Enable Publishing on the Site A library.

Answer: C,D,E

NEW QUESTION # 86

A VKS Administrator wants to Uninstall a Supervisor Service (e.g., a test instance of MinIO) to free up resources.

What is the impact of uninstalling a service on the Persistent Data associated with it (e.g., the MinIO buckets)?

- A. The service is paused, but data is kept.
- B. The Uninstall operation deletes the dedicated vSphere Namespace created for that service instance, which permanently deletes all Pods, Secrets, and Persistent Volumes (Data) contained within it.
- C. The data is archived to the Content Library.
- D. By default, the uninstall workflow deletes the Service Instance and its compute resources (Pods), but the Persistent Volume Claims (PVCs) and the underlying data are typically Retained (unless the specific service operator logic or a "Force Delete" option effectively purges them, but standard K8s practice for stateful sets often leaves PVCs to prevent accidental data loss). Self-Correction: In the vSphere Client workflow for Supervisor Services, "Remove" typically deletes the SupervisorService CR.
The behavior depends on the Operator managing it. However, vSphere often warns that data might be lost or asks. A key exam point is understanding that Uninstall removes the active logic. But usually, for Supervisor Services specifically, it cleans up the namespace created for the service instance.
- E. The data remains on the datastore as orphaned VMDKs.

Answer: B

NEW QUESTION # 87

A VI Administrator wants to configure the Cluster Autoscaler behavior for a specific TKG cluster to be less aggressive when scaling down nodes, to prevent "flapping" during short lulls in traffic.

Which of the following are valid configuration methods or parameters to tune the scale-down behavior in vSphere with Tanzu? (Select all that apply.)

- A. It is not possible to tune autoscaler parameters; the default values are hardcoded in the Supervisor services.
- B. Adjust the cluster-api-autoscaler-node-group-scale-down-delay-after-add annotation (or equivalent global setting if exposed) to increase the cooldown period after a scale-up event.
- C. Configure the scale-down-unneeded-time parameter (often passed via TkgServiceConfiguration or specific cluster annotations depending on version) to define how long a node must be unnecessary before it is terminated.
- D. Set the min-size equal to the max-size to disable scale down entirely.
- E. Edit the HorizontalPodAutoscaler definition to reduce the stabilization window.

Answer: B,C,D
