Our laTest Plat-Admn-301 Pdf file materials will ease your annoyance while preparing & reading, and then get better benefits and good opportunities.

Salesforce Certified Platform Administrator II Sample Questions (Q48-Q53):

NEW QUESTION # 48

Cloud Kicks (CK) has a field called Shoe Type Preference, CK,s product team wants to see a report that groups specific picklist values together into the one of two lists.

What functionality should the administrator use to fulfill the team's request?

- A. Matrix Report
- B. Bucket field

- C. PREVGROUPVALUE
- D. Summary Formula

Answer: B

Explanation:

Bucket field is a feature that allows administrators to group report values into categories without changing the data in Salesforce. Bucket field can help simplify reports and charts by reducing the number of values displayed and summarizing data based on criteria such as ranges or groups. Bucket field can be used to group specific picklist values together into one of two lists

NEW QUESTION # 49

Management at Ursa Major Solar wants to understand how many accounts have opportunities in the overall pipeline.

What should the administrator use to create a report showing all open opportunities and the total number of accounts represented?

- A. A Cross Filter selecting opportunities with accounts
- **B. The Show Unique Count option on the account name column**
- C. The row count on a summary report grouped by account name
- D. A custom report type showing opportunities with accounts

Answer: B

Explanation:

The Show Unique Count option on the account name column will create a report showing all open opportunities and the total number of accounts represented. This option will count each account only once, even if it has multiple opportunities. The report can be grouped by account name or any other field to show more details. NEW QUESTION # 50

A user at Universal Containers wants to load records into a custom object named Location from a .csv file.

While using Data Loader, they cannot find the Location object.

What are two reasons this is happening?

Choose 2 answers

- **A. The user's profile needs create access to Location.**
- B. Data Loader should only be used with standard objects.
- **C. The label of Location may have been changed.**
- D. Location has a master-detail field to Account.

Answer: A,C

Explanation:

Two reasons why the user cannot find the Location object while using Data Loader are:

* The label of Location may have been changed. The label of an object is the name that is displayed in the user interface and can be different from the API name that is used by Data Loader and other tools. If the label of Location has been changed to something else, such as Site or Venue, then the user may not be able to find it by searching for Location in Data Loader. The user should check the API name of the object in Object Manager or use the Describe Global operation in Data Loader to see all available objects and their labels.

* The user's profile needs create access to Location. The user's profile determines what objects and fields they can access and what actions they can perform on them, such as creating, reading, updating, or deleting records. If the user's profile does not have create access to Location, then they will not be able to load records into that object using Data Loader. The user should check their profile permissions in Setup or ask their administrator to grant them create access to Location.

The other two options are incorrect because:

* Data Loader should only be used with standard objects is not a reason because Data Loader can be used with both standard and custom objects, as long as they are accessible and queryable via the API.

* Location has a master-detail field to Account is not a reason because having a master-detail field does not prevent an object from being available in Data Loader, as long as it meets the other requirements such as accessibility and queryability.

NEW QUESTION # 51

Cloud Kicks wants to force its users to set a value for a custom called Tier by answering a series of questions.

What two functions should the administrator use to ensure that users cannot bypass answering these questions in order to determine their Tier value.

Choose 2 answers

- A. Set up a restriction rule on the field.
- B. Make the field Read Only on the page layout.
- C. Use a screen flow to ask the question.
- D. Set up a list view for the list of questions.

Answer: B,C

Explanation:

Making the field Read Only on the page layout prevents users from manually entering or editing the field value on the record page. This ensures that users cannot bypass answering the questions in order to determine their Tier value. Using a screen flow to ask the questions allows administrators to create an interactive user interface that guides users through a series of screens based on their inputs and logic. A screen flow can be used to ask questions and set the field value based on the answers

NEW QUESTION # 52

The administrator at AW Computing has been asked to review whether any users are making configuration changes directly in production.

Which item should the administrator review to find these details?

- A. Field History Tracking
- B. Setup Audit Trail
- C. Organization-Wide Defaults
- D. Login History

Answer: B

Explanation:

The Setup Audit Trail is a tool that allows you to view and download a log of changes made in your org's Setup area. The log shows up to 20 fields of information for each change, such as who made it, when it was made, what type of change it was, and what values were changed. You can use the Setup Audit Trail to track configuration changes directly in production and identify any unauthorized or problematic changes.
