#### NEW QUESTION # 513

Which of the following activities BEST identifies operational problems, security misconfigurations, and malicious attacks?

- A. Interface testing
- B. Policy documentation review
- C. Authentication validation
- D. Periodic log reviews

**Answer: D**

Explanation:

The activity that best identifies operational problems, security misconfigurations, and malicious attacks is periodic log reviews. Log reviews are the process of examining and analyzing the records of events or activities that occur on a system or network, such as user actions, system errors, security alerts, or network traffic. Periodic log reviews can help to identify operational problems, such as system failures, performance issues, or configuration errors, by detecting anomalies, trends, or patterns in the log data. Periodic log

reviews can also help to identify security misconfigurations, such as weak passwords, open ports, or missing patches, by comparing the log data with the security policies, standards, or baselines. Periodic log reviews can also help to identify malicious attacks, such as unauthorized access, data breaches, or denial of service, by recognizing signs of intrusion, compromise, or exploitation in the log data.

#### NEW QUESTION # 514

Which of the following management process allows ONLY those services required for users to accomplish their tasks, change default user passwords, and set servers to retrieve antivirus updates?

- A. Identity
- B. Patch
- C. Compliance
- **D. Configuration**

**Answer: D**

Explanation:

The management process that allows only those services required for users to accomplish their tasks, change default user passwords, and set servers to retrieve antivirus updates is configuration. Configuration is the process of setting and adjusting the parameters and options of a system or a network, such as hardware, software, or services, to meet the requirements and objectives of the organization. Configuration can provide some benefits for security, such as enhancing the performance and the functionality of the system or the network, preventing or mitigating some types of attacks or vulnerabilities, and supporting the audit and compliance activities. Configuration can involve various techniques and tools, such as configuration management, configuration control, configuration auditing, or configuration baselines. Configuration can allow only those services required for users to accomplish their tasks, change default user passwords, and set servers to retrieve antivirus updates, by using the following methods:

\* Enabling or disabling the services that are necessary or unnecessary for the system or the network, such as file sharing, remote access, or printing. This can help to reduce the attack surface and the exposure of the system or the network, as well as to optimize the resource utilization and the bandwidth consumption.

\* Changing the default user passwords that are provided by the vendors or the manufacturers of the system or the network, such as routers, switches, or servers. This can help to prevent or mitigate some types of attacks or unauthorized access, such as brute force, dictionary, or credential stuffing, by using strong and unique passwords that are difficult to guess or crack.

\* Setting the servers to retrieve antivirus updates automatically or periodically from the trusted sources, such as the antivirus vendors or the security providers. This can help to protect the system or the network from malware infections or exploits, by updating and applying the latest malware signatures, heuristics, or behavioral analysis to the system or the network.
