AP-202 Practice Exam - Authorized AP-202 Exam Dumps

Our company deeply knows that product quality is very important, so we have been focusing on ensuring the development of a high quality of our AP-202 test torrent. All customers who have purchased our products have left deep impression on our AP-202 guide torrent. Of course, the customer not only has left deep impression on the high quality of our products but also the efficiency of our products. Our AP-202 Exam Questions can help you save much time, if you use our AP-202 study prep, you just need to spend 20-30 hours on learning, and you will pass your AP-202 exam successfully.

Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q179-Q184):

NEW QUESTION # 179

Which option is the correct syntax to render a property in a Lightning web component template?

- A. Surround the property with curly braces: {property}
- B. Surround the property with brackets: [property]
- C. Surround the property with curly braces and exclamation point: {{property}}
- D. Surround the property with an exclamation point and curly braces: {!property}

Answer: A

Explanation:

The correct syntax to render a property in a Lightning web component template is to surround the property with curly braces: {property}. This syntax allows you to access the property value from the JavaScript class of the component and display it in the HTML template. The other options are incorrect because they either use invalid characters or do not follow the standard syntax for rendering a property in a Lightning web component template. Use JavaScript Properties in Templates | Lightning Web Components Developer Guide

NEW QUESTION # 180

Which method needs to be implemented when rendering a Salesforce B2B Commerce view in order to have it called after rendering has finished?

- A. onRender()
- B. afterRender()
- C. There are no methods called on the view after rendering has finished
- D. postRender()

Answer: D

Explanation:

The method that needs to be implemented when rendering a Salesforce B2B Commerce view in order to have it called after rendering has finished is postRender. This method is an optional hook that can be defined by the user to perform any actions or logic that depend on the view being rendered, such as initializing widgets, binding events, or updating the user interface. The method will be called by the render method of the CCRZ.View class, which is the base class for all views in the framework. Salesforce B2B Commerce and D2C Commerce Developer Guide, View Class

NEW QUESTION # 181

How are variables bound when services use the ccServiceDao class to execute queries?

- A. String substitution
- B. Apex class variables
- C. Global variables
- D. Apex local variables

Answer: A

Explanation:

When services use the ccServiceDao class to execute queries, variables are bound by string substitution. This means that the query string contains placeholders for variables that are replaced by their values at runtime. For example, `ccrz.ccServiceDao.getQuery('SELECT Id FROM Account WHERE Name = :name')` will replace `:name` with the value of `theName` variable.

NEW QUESTION # 182

A developer needs to import some new product data contained in a JSON file one time. What are two viable ways to do this? .

- A. Run a command like: `sfdx force:data:tree:import -f NewProducts.json -u <your username>`
- B. Run a command like: `sfdx force:data:import:bulk -f NewProducts.json -u <your username>`
- C. Convert the JSON to a CSV file and use Data Loader to import it
- D. Convert the JSON to an xlsx file and use Workbench to import it

Answer: A,C

Explanation:

Two viable ways that a developer can import some new product data contained in a JSON file one time are running a command like: `sfdx force:data:tree:import -fNewProducts.json -u <your username>` and converting the JSON to a CSV file and using Data Loader to import it. Running a command like: `sfdx force:data:tree:import -fNewProducts.json -u <your username>` allows the developer to import data from a JSON file into an org using Salesforce CLI commands. The `sfdx force:data:tree:import` command is a Salesforce CLI command that imports data into an org using JSON files that conform to the SOBJect Tree API specification. The SOBJect Tree API specification is a format that defines how records are represented in JSON files for data import or export. The `-f` flag specifies the path of the JSON file that contains the data to be imported. The `-u` flag specifies the username or alias of the org where the data will be imported. Running this command will create records in the org based on the data in the JSON file. Converting the JSON to a CSV file and using Data Loader to import it allows the developer to import data from a CSV file into an org using Data Loader. Data Loader is a tool that allows users to import or export data between Salesforce and CSV files. The developer can use an online converter or a spreadsheet application to convert their JSON file into a CSV file that matches the structure and format of their Salesforce object. The developer can then use Data Loader to import the CSV file into their org and create records based on the data in the CSV file. Converting the JSON to an xlsx file and using Workbench to import it is not a viable way to import some new product data contained in a JSON file one time, as Workbench does not support xlsx files for data import or export. Workbench is a web-based tool that provides access to various Salesforce features and functionalities, such as data manipulation, REST Explorer, and Apex Execute. Running a command like: `sfdx force:data;import:bulk -fNewProducts.json -u <your username>` is not a viable way either, as there is no such command as `sfdx force:data;import:bulk`. The correct command for importing data using bulk API is `sfdx force:data:bulk:upsert`. Salesforce [Salesforce CLI Command `force:data:tree:import`], [Salesforce Developer Tools for Visual Studio Code], [Data Loader Guide: Import Data into Salesforce], [Workbench], [Salesforce CLI Command `force:data:bulk:upsert`]

NEW QUESTION # 183

What are two considerations to keep in mind when including additional JavaScript files in a Lightning web component?

- A. The files must be ES6 modules and must have names that are unique within the component's folder.
- B. Additional JavaScript files should be minified before deployment
- C. Each additional file needs a corresponding `.js-meta.xml` file.
- D. A module can export named functions or variables

Answer: A,D

Explanation:

When including additional JavaScript files in a Lightning web component, a developer should keep in mind two considerations: the files must be ES6 modules and must have names that are unique within the component's folder and a module can export named functions or variables. The files must be ES6 modules because LWC uses ES6 modules as the standard for modular JavaScript code. The files must have names that are unique within the component's folder because LWC uses the file name as the module identifier and does not allow duplicate identifiers. A module can export named functions or variables because LWC supports named exports, which allow a module to export multiple values with different names. Each additional file does not need a corresponding `.js-meta.xml` file, as this is only required for the main JavaScript file of the component. Additional JavaScript files should not be minified before deployment, as this is not necessary or recommended for LWC. Salesforce [Lightning Web Components Developer Guide: Include JavaScript Files], [Lightning Web Components Developer Guide: ES6 Modules]

NEW QUESTION # 184

.....

Our experts are responsible to make in-depth research on the AP-202 exam who contribute to growth of our AP-202 preparation materials even the practice materials in the market as role models. Both normal and essential exam knowledge is written by them with digestible ways to understand. Their highly accurate exam point can help you detect flaws on the review process and trigger your enthusiasm about the exam.
