What's more, with the skilled professionals to compile the Plat-Dev-301 Exam Dumps, quality and accuracy can be guaranteed. Therefore, you can use the Plat-Dev-301 exam dumps of us with ease. We have online and offline chat service stuff, if any questions bother you, just consult us.

Salesforce Certified Platform Developer II - Multiple Choice Sample Questions (Q69-Q74):

NEW QUESTION # 69

A developer is working with existing functionality that tracks how many times a stage has changed for an Opportunity. When the Opportunity's stage is changed, a workflow rule is fired to increase the value of a field by one. The developer wrote an after trigger to create a child record when the field changes from 4 to 5.

A user changes the stage of an Opportunity and manually sets the count field to 4. The count field updates to 5, but the child record is not created.

What is the reason this is happening?

- A. Trigger.old does not contain the updated value of the count field.
- B. After triggers are not fired after field updates.
- C. After triggers fire before workflow rules.
- D. Trigger.new does not change after a field update.

Answer: A

Explanation:

<https://help.salesforce.com/s/articleView?id=000384697&type=1>

NEW QUESTION # 70

Assuming the CreateOneAccount class creates one account and implements the Queueable interface, which syntax properly tests the Apex code?

A)

```
List<Account> accts;  
System.enqueueJob( new CreateOneAccount() );  
Test.startTest();  
System.assertEquals(1, accts.size() );  
Test.stopTest();
```

B)

```
List<Account> accts;  
Test.startTest();  
System.enqueueJob( new CreateOneAccount() );  
Test.stopTest();  
accts = [SELECT Id FROM Account];  
System.assertEquals( 1, accts.size() );
```

C)

```
List<Account> accts;  
System.enqueueJob( new CreateOneAccount() );  
Test.getFlexQueueOrder();  
System.assertEquals( 1, accts.size() );
```

D)

```
List<Account> accts;  
System.enqueueJob( new CreateOneAccount() );  
accts = [SELECT Id FROM Account];  
System.assertEquals(1, accts.size() );
```

- A. Option A
- **B. Option B**
- C. Option C
- D. Option D

Answer: B

Explanation:

To test Queueable Apex, Test.startTest() and Test.stopTest() should be used to ensure the asynchronous code is executed before assertions are made. After calling Test.stopTest(), you would then query for the records to assert that the queueable job correctly created the Account records.

NEW QUESTION # 71

There are user complaints about slow render times of a custom data table within a Visualforce page that loads thousands of Account records at once.

What can a developer do to help alleviate such issues?

- **A. Use the standard Account List controller and implement pagination.**
- B. Use the transient keyword in the Apex code when querying the Account records.
- C. Use JavaScript remoting to query the accounts.
- D. Upload a third-party data table library as a static resource.

Answer: A

Explanation:

Implementing pagination using the standard Account List controller in Visualforce is a proven method to improve performance when displaying large sets of data. Pagination allows only a subset of records to be fetched and displayed at a time, thereby reducing the load time of the page.

NEW QUESTION # 72

A developer wants to write a generic Apex method that will compare the Salesforce Name field between any two object records. For example, to compare the Name field of an Account and an Opportunity; or the Name of an Account and a Contact. Assuming the Name field exists, how should the developer do this?

- A. Use a string.Replace() method to parse the contents of each Name field and then compare the results.
- **B. Cast each object into an sObject and use sObject.get to compare the Name fields.**
- C. describe() function to compare the values of each Name field.
- D. Use the Salesforce Metadata API to extract the value of each object and compare the Name fields.

Answer: B

Explanation:

Casting each object to an sObject and using the get method to compare the Name fields is the correct approach. This is because sObjects are generic object representations that can be used to access the fields of any Salesforce object dynamically. Reference: sObject Class

NEW QUESTION # 73

A software company uses a custom object, Defect__c, to track defects in their software. Defect__c has organization-wide defaults set to private. Each Defect__c has a related list of Reviewer__c records, each with a lookup field to User that is used to indicate that the User will review the defect__c.

What should be used to give the User on the Reviewer__c record read only access to the Defect__c record on the Reviewer__c record?

- A. Lightning web component
- **B. Apex managed sharing**
- C. Criteria-based sharing
- D. View All on Defect__c

Answer: B

Explanation:

Apex managed sharing is used to programmatically share records when organization-wide defaults are private. It allows for creating share records that give read-only access to users specified in a related list.

NEW QUESTION # 74

.....

Don't waste time, buy the latest Plat-Dev-301 pdf questions and practice tests from TorrentValid and get successful. You can free download the demo of any format of Salesforce Plat-Dev-301 test questions before purchase.
