Splunk O11y Cloud Certified Metrics User Sample Questions (Q39-Q44):

NEW QUESTION # 39

What is the limit on the number of properties that an MTS can have?

- A. 0
- B. 1
- **C. 2**
- D. No limit

Answer: C

Explanation:

The correct answer is A. 64.

According to the web search results, the limit on the number of properties that an MTS can have is 64. A property is a key-value pair that you can assign to a dimension of an existing MTS to add more context to the metrics. For example, you can add the property use: QA to the host dimension of your metrics to indicate that the host is used for QA1 Properties are different from dimensions, which are key-value pairs that are sent along with the metrics at the time of ingest. Dimensions, along with the metric name, uniquely identify an MTS. The limit on the number of dimensions per MTS is 362 To learn more about how to use properties and dimensions in Splunk Observability Cloud, you can refer to this documentation².

NEW QUESTION # 41

A customer is experiencing an issue where their detector is not sending email notifications but is generating alerts within the Splunk Observability UI. Which of the below is the root cause?

- A. The detector is disabled.
- B. The detector has an incorrect alert rule.
- C. The detector has an incorrect signal,
- **D. The detector has a muting rule.**

Answer: D

Explanation:

The most likely root cause of the issue is D. The detector has a muting rule.

A muting rule is a way to temporarily stop a detector from sending notifications for certain alerts, without disabling the detector or changing its alert conditions. A muting rule can be useful when you want to avoid alert noise during planned maintenance, testing, or other situations where you expect the metrics to deviate from normal¹. When a detector has a muting rule, it will still generate alerts within the Splunk Observability UI, but it will not send email notifications or any other types of notifications that you have configured for the detector. You can see if a detector has a muting rule by looking at the Muting Rules tab on the detector page. You can also create, edit, or delete muting rules from there¹. To learn more about how to use muting rules in Splunk Observability Cloud, you can refer to this documentation¹.

NEW QUESTION # 42

Which of the following rollups will display the time delta between a datapoint being sent and a datapoint being received?

- A. Latency
- B. Delay
- C. Jitter
- **D. Lag**

Answer: D

Explanation:

Explanation

According to the Splunk Observability Cloud documentation¹, lag is a rollup function that returns the difference between the most recent and the previous data point values seen in the metric time series reporting interval. This can be used to measure the time delta between a data point being sent and a data point being received, as long as the data points have timestamps that reflect their send and receive times. For example, if a data point is sent at 10:00:00 and received at 10:00:05, the lag value for that data point is 5 seconds.

NEW QUESTION # 43

Which of the following are true about organization metrics? (select all that apply)

- **A. Organization metrics give insights into system usage, system limits, data ingested and token quotas.**
- **B. Organization metrics are included for free.**
- C. Organization metrics count towards custom MTS limits.
- **D. A user can plot and alert on them like metrics they send to Splunk Observability Cloud.**

Answer: A,B,D

Explanation:

The correct answer is A, C, and D. Organization metrics give insights into system usage, system limits, data ingested and token quotas. Organization metrics are included for free. A user can plot and alert on them like metrics they send to Splunk Observability Cloud.

Organization metrics are a set of metrics that Splunk Observability Cloud provides to help you measure your organization's usage of the platform. They include metrics such as:

Ingest metrics: Measure the data you're sending to Infrastructure Monitoring, such as the number of data points you've sent.

App usage metrics: Measure your use of application features, such as the number of dashboards in your organization.

Integration metrics: Measure your use of cloud services integrated with your organization, such as the number of calls to the AWS CloudWatch API.

Resource metrics: Measure your use of resources that you can specify limits for, such as the number of custom metric time series (MTS) you've created¹. Organization metrics are not charged and do not count against any system limits. You can view them in built-in charts on the Organization Overview page or in custom charts using the Metric Finder. You can also create alerts based on organization metrics to monitor your usage and performance¹. To learn more about how to use organization metrics in Splunk Observability Cloud, you can refer to this documentation¹.
