If there is any issue while using our Professional-Cloud-Developer updated exam product, contact our customer support. We will resolve your issues related to the Professional-Cloud-Developer practice material as soon as possible. For quick and successful Google Certified Professional - Cloud Developer test preparation, download Professional-Cloud-Developer Real Exam dumps today.

Google Professional-Cloud-Developer Certification Exam is an excellent opportunity for developers to demonstrate their skills and knowledge of GCP services and technologies. Google Certified Professional - Cloud Developer certification is highly valued in the industry, and it can help professionals advance their careers in cloud-based application development. Candidates who pass the exam are recognized as Google Certified Professional - Cloud Developers, which is an excellent way to showcase their expertise and differentiate themselves from their peers.

Reliable Professional-Cloud-Developer Exam Test Spend Your Little Time and Energy to Pass Professional-Cloud-Developer: Google Certified Professional - Cloud Developer exam

Especially for those students who are headaches when reading a book, Professional-Cloud-Developer study tool is their gospel. Because doing exercises will make it easier for one person to concentrate, and at the same time, in the process of conducting a mock examination to test yourself, seeing the improvement of yourself will makes you feel very fulfilled and have a stronger interest in learning. Professional-Cloud-Developer Guide Torrent makes your learning process not boring at all.

Google Professional-Cloud-Developer Certification Exam is a highly sought-after certification in the field of cloud computing. It is one of the most prestigious certifications offered by Google and is designed to test an individual's proficiency in developing applications on the Google Cloud Platform. Google Certified Professional - Cloud Developer certification exam is intended for developers who have a strong understanding of cloud computing concepts, software development, and the Google Cloud Platform.

Google Certified Professional - Cloud Developer Sample Questions (Q65-Q70):

NEW QUESTION # 65

You work for an environmental agency in a large city. You are developing a new monitoring platform that will capture air quality readings from thousands of locations in the city. You want the air quality reading devices to send and receive their data payload to the newly created RESTful backend systems every minute by using a curl command. The backend systems are running in a single cloud region and are using Premium Tier networking. You need to connect the devices to the backend while minimizing the daily average latency, measured by using Time to First Byte (TTFB). How should you build this service?

- A. 1. Run the air quality devices' backends on Compute Engine VMs.
2. Create a weighted round robin routing policy on Cloud DNS.
3. Configure the air quality devices to connect by using this DNS.
- B. 1. Run the air quality devices' backends in a managed instance group.
2. Create an external passthrough Network Load Balancer to connect to the managed instance group.
3. Configure a connection between the air quality devices and the Network Load Balancer.

- C. 1. Run the air quality devices' backends on Compute Engine VMs.
2. Create a round robin routing policy on Cloud DNS for these Compute Engine VMs.
3. Configure the air quality devices to connect by using this DNS.
- D. 1 Run the air quality devices' backends in a managed instance group.
2. Create an external Application Load Balancer, and connect it to the managed instance group.
3. Configure a connection between the air quality devices and the Application Load Balancer.

Answer: D

Explanation:

NEW QUESTION # 66

You want to view the memory usage of your application deployed on Compute Engine. What should you do?

- A. Install the Stackdriver Monitoring Agent.
- B. Use the Google Cloud Platform Console.
- C. Install the Stackdriver Client Library.
- D. Use the Stackdriver Metrics Explorer.

Answer: D

Explanation:

Reference:

<https://stackoverflow.com/questions/43991246/google-cloud-platform-how-to-monitor-memory-usage-of-vm-instances>

NEW QUESTION # 67

Your company is planning a global event. You need to configure an event registration portal for the event. You have decided to deploy the registration service by using Cloud Run. Your company's marketing team does not want to advertise the Cloud Run service URL. They want the registration portal to be accessed by using a personalized hostname or path in your custom domain URL pattern, for example, <service>.example.com. How should you configure access to the service while following Google-recommended practices?

- A. Configure Cloud Armor to block traffic on the Cloud Run service URL and allow reroutes from only the custom domain URL pattern.
- B. Create a CNAME record that points to the Cloud Run service URL.
- C. Add a global external Application Load Balancer in front of the service, and configure a DNS record that points to the load balancer's IP address.
- D. Set up an HAProxy on Compute Engine, and add routing rules for a custom domain to the Cloud Run service URL.

Answer: C

Explanation:

Using a global external Application Load Balancer allows you to serve your Cloud Run service behind a custom domain with flexible routing and SSL support, following Google-recommended best practices for production workloads.

NEW QUESTION # 68

Your application takes an input from a user and publishes it to the user's contacts. This input is stored in a table in Cloud Spanner. Your application is more sensitive to latency and less sensitive to consistency. How should you perform reads from Cloud Spanner for this application?

- A. Perform stale reads using single-read methods.
- B. Perform Read-Only transactions.
- C. Perform strong reads using single-read methods.
- D. Perform stale reads using read-write transactions.

Answer: D

Explanation:

Topic 1, HipLocal Case Study Company Overview

HipLocal is a community application designed to facilitate communication between people in close proximity.

It is used for event planning and organizing sporting events, and for businesses to connect with their local communities. HipLocal launched recently in a few neighborhoods in Dallas and is rapidly growing into a global phenomenon. Its unique style of hyper-local community communication and business outreach is in demand around the world.

Executive statement

We are the number one local community app; it's time to take our local community services global. Our venture capital investors want to see rapid growth and the same great experience for new local and virtual communities that come online, whether their members are 10 or 10,000 miles away from each other.

Solution concept

HipLocal wants to expand their existing service, with updated functionality, in new regions to better serve their global customers.

They want to hire and train a new team to support these regions in their time zones.

They will need to ensure that the application scales smoothly and provides clear uptime data.

Existing technical environment

HipLocal's environment is a mix of on-premises hardware and infrastructure running in Google Cloud Platform. The HipLocal team understands their application well but has limited experience in global scale applications. Their existing technical environment is as follows:

- * Existing APIs run on Compute Engine virtual machine instances hosted in GCP
 - * State is stored in a single instance MySQL database in GCP
 - * Data is exported to an on-premises Teradata/Vertica data warehouse
 - * Data analytics is performed in an on-premises Hadoop environment
 - * The application has no logging
 - * There are basic indicators of uptime; alerts are frequently fired when the APIs are unresponsive
- Business requirements HipLocal's investors want to expand their footprint and support the increase in demand they are seeing. Their requirements are:
- * Expand availability of the application to new regions
 - * Increase the number of concurrent users that can be supported
 - * Ensure a consistent experience for users when they travel to different regions
 - * Obtain user activity metrics to better understand how to monetize their product
 - * Ensure compliance with regulations in the new regions (for example, GDPR)
 - * Reduce infrastructure management time and cost
 - * Adopt the Google-recommended practices for cloud computing

Technical requirements

- * The application and backend must provide usage metrics and monitoring
- * APIs require strong authentication and authorization
- * Logging must be increased, and data should be stored in a cloud analytics platform
- * Move to serverless architecture to facilitate elastic scaling
- * Provide authorized access to internal apps in a secure manner

NEW QUESTION # 69

Your company's corporate policy states that there must be a copyright comment at the very beginning of all source files. You want to write a custom step in Cloud Build that is triggered by each source commit. You need the trigger to validate that the source contains a copyright and add one for subsequent steps if not there.

What should you do?

- A. Build a new Docker container that examines the files in a Cloud Storage bucket and then checks and adds a copyright for each source file. Changed files are explicitly committed back to the source repository.
- **B. Build a new Docker container that examines the files in /workspace and then checks and adds a copyright for each source file. Changed files are explicitly committed back to the source repository.**
- C. Build a new Docker container that examines the files in a Cloud Storage bucket and then checks and adds a copyright for each source file. Changed files are written back to the Cloud Storage bucket.
- D. Build a new Docker container that examines the files in /workspace and then checks and adds a copyright for each source file. Changed files do not need to be committed back to the source repository.

Answer: B

Explanation:

Explanation

https://cloud.google.com/build/docs/configuring-builds/pass-data-between-steps#passing_data_using_workspace To pass data

between build steps, store the assets produced by the build step in /workspace and these assets will be available to any subsequent build steps.
