TDA-C01 Reliable Exam Pass4sure - Reliable TDA-C01 Dumps Free

You have seen Exams-boost's Tableau TDA-C01 Exam Training materials, it is time to make a choice. You can choose other products, but you have to know that Exams-boost can bring you infinite interests. Only Exams-boost can guarantee you 100% success. Exams-boost allows you to have a bright future. And allows you to work in the field of information technology with high efficiency.

Tableau Certified Data Analyst Sample Questions (Q158-Q163):

NEW QUESTION # 158

You want to add a comment to March 2020 as shown in the following visualization.

You have the following sets in a Tableau workbook

- * Top N Customers
- * Customers of 2020
- * Top N Products
- * Sellers of 2020

Which two sets can you combine? Choose two

- A. Customers of 2020
- B. Sellers of 2020

- C. Top N Customers
- D. Top N Products

Answer: A,C

Explanation:

To combine two sets, they must have at least one dimension in common. In this case, Customers of 2020 and Top N Customers both have Customer Name as a dimension, so they can be combined using set operations such as union, intersection, or difference. Sellers of 2020 and Top N Products have different dimensions (Seller Name and Product Name), so they cannot be combined.

References: <https://help.tableau.com/current/pro/desktop/en-us/sets.htm>

https://help.tableau.com/current/pro/desktop/en-us/sets_create.htm#combine-sets In Tableau, sets can be combined if they are created from the same dimension. From the options provided,

"Customers of 2020" and "Top N Customers" are likely created from the same dimension (Customers).

Therefore, these two sets can be combined to create a new set that includes or excludes members based on the combined criteria. Combining sets like "Top N Products" with "Customers of 2020" would not be feasible unless they are from the same dimension, which is typically not the case.

NEW QUESTION # 159

In a dataset, you have a string field named Name that contains unnecessary semicolons.

Which function should you use to remove the semicolons from the Name field?

- A. TRIM
- B. SPLIT
- C. CONTAINS
- D. REPLACE

Answer: D

Explanation:

The REPLACE function is used to replace all occurrences of a substring within a string with another substring. In this case, it can be used to remove the semicolons from the Name field by replacing them with an empty string. For example, REPLACE ("John;Doe", ";", "") = "JohnDoe". Reference: The information is based on the following sources:

Remove special characters and add a semi colon in a word - Tableau

NEW QUESTION # 160

From Tableau Desktop you sign in to a Tableau Server site.

What appears in the list of available data sources when you search for a published data source?

- A. All the data sources published to the Tableau Server within the folders to which you have access
- B. All the data sources published to the site
- C. All the data sources published to the Tableau Server
- D. All the data sources published to the site within the folders to which you have access

Answer: D

Explanation:

When you sign in to a Tableau Server site from Tableau Desktop and search for a published data source, you will see all the data sources published to the site within the folders to which you have access. You will not see data sources published to other sites or folders that you do not have permission to view. You can also filter your search by project, owner, or tag. References:

https://help.tableau.com/current/pro/desktop/en-us/connect_basic.htm

https://help.tableau.com/current/pro/desktop/en-us/connect_tableauserver.htm When signed in to Tableau Server from Tableau Desktop, you'll only be able to see the data sources that have been published to the site and are within the folders that you have been granted access to. Tableau's permission and project structure mean that you won't see all data sources from the entire server unless you have permissions to do so.

NEW QUESTION # 161

You have the following dataset.

□ You want to create a new calculated dimension field named Category that meets the following conditions:
 . When Subject is Computer Science or Science, Category must be Sciences.
 . When Subject is English or Social Studies, Category must be Humanities.
 Which two logical functions achieve the goal? Choose two.

- A. CASE [Subject]
`WHEN 'Computer Science' THEN 'Sciences'
 WHEN 'Science' THEN 'Sciences'
 WHEN 'English' THEN 'Humanities'
 WHEN 'Social Studies' THEN 'Humanities'
 End`
- B. IF [Subject]- 'Science' THEN 'Sciences'
`ELSEIF [Subject]='English' THEN 'Humanities'
 ELSEIF [Subject]='Social Studies' THEN 'Humanities'
 ELSEIF [Subject]='Computer Science' THEN 'Sciences'
 END`
- C. IIF((CONTAINS ([Subject], 'Science') = TRUE) , 'Humanities', 'Sciences')
- D. IF ENDSWITH ([Subject], 'Computer Science') THEN 'Sciences' ELSE 'Humanities' END

Answer: A,B

Explanation:

To create a new calculated dimension field named Category that meets the given conditions, you can use either the IF or the CASE logical function. Both functions allow you to evaluate an expression and return a value based on different scenarios. Option A uses the IF function with multiple ELSEIF clauses to check the value of the Subject field and assign it to either 'Sciences' or 'Humanities'. Option D uses the CASE function with multiple WHEN clauses to do the same thing. Both options will produce the same result, but the CASE function is more concise and easier to read. Option B is incorrect because it will assign 'Humanities' to any subject that contains 'Science' in its name, which is not the desired outcome. Option C is incorrect because it will only check if the subject ends with 'Computer Science' and ignore the other subjects. Reference:

NEW QUESTION # 162

You have a data source that contains data for every city in the United States. The following is a sample of the data.

□ You need to use the City dimension to create a dynamic filter that shows the cities that have a population greater than one million
 Which type of filter should you use?

- A. General filter
- B. Condition filter
- C. Wildcard filter
- D. Top filter

Answer: B

Explanation:

To use the City dimension to create a dynamic filter that shows the cities that have a population greater than one million, you should use a condition filter. A condition filter is a type of filter that shows only the values that meet a specified condition based on a measure or a calculation. You can create a condition filter by dragging a dimension to the Filters shelf and selecting Condition from the dialog box. Then you can enter a formula or choose an option that defines your condition.

In this case, you want to create a condition filter based on Population, which is a measure. You can drag City to the Filters shelf and select Condition from the dialog box. Then you can choose By field from the tab and select Population > Sum > Greater than > 1000000 from the drop-down lists. This will create a condition filter that shows only the cities that have a sum of population greater than one million.

The other options are not correct for this scenario. A general filter is not a specific type of filter, but a term that refers to any type of filter in Tableau. A wildcard filter is a type of filter that shows only the values that match a specified pattern or string, such as "New*" or "*ton". A top filter is a type of filter that shows only the top or bottom N values of a measure or dimension based on a ranking or an aggregation. Reference: <https://help.tableau.com/current/pro/desktop/en-us/filtering.htm>
