Our third format is the desktop practice CWAP-405 exam software which can be used easily after installing it on your Windows laptop and computers. These formats are there so that applicants with different study styles can use them to attempt the Certified Wireless Analysis Professional (CWAP-405) PRACTICE QUESTIONS successfully. The practice material of Pass4sureCert can be instantly accessed just after purchasing it.

CWNP Certified Wireless Analysis Professional Sample Questions (Q59-Q64):

NEW QUESTION # 59

You are attempting to determine timing information within a packet capture of a WLAN protocol analyzer. What time is used to display the time the packet was captured based on the system clock in the computer?

- A. Interframe
- B. Relative
- C. Arrival
- D. Delta

Answer: C

Explanation:

Arrival Time- This is the time that is assigned to a packet after it is processed by the host system. This timestamp is dependent upon the system clock of the computer, and designates when the packet was captured.

NEW QUESTION # 60

As the WLAN engineer in your organization, you must troubleshoot performance problems related to co- channel interference (CCI).

What is a good measurement of CCI impact in addition to the number of APs seen on a channel?

- A. Non-Wi-Fi device count
- B. The frequency used
- C. Utilization
- D. Retries

Answer: B

NEW QUESTION # 61

You are explaining capacity planning to another engineer assisting you on a WLAN implementation project. As part of the explanation, you provide the following formula: $C = B * \log_2(1 + S/N)$.

What does this formula define?

- A. Bandwidth capabilities of a channel
- B. Maximum signal strength of a channel
- C. The WEP encryption algorithm
- D. Minimum signal strength for a data rate

Answer: A

NEW QUESTION # 62

Which one of the following portions of information is communicated by bits in the PHY Header?

- A. Signal strength
- B. Data rate
- C. Noise
- D. SNR

Answer: B

Explanation:

One of the information that is communicated by bits in the PHY header is data rate. Data rate is the speed at which data is transmitted or received over the wireless medium. Data rate depends on factors such as modulation, coding, channel width, spatial streams, and guard interval. Data rate is indicated by bits in different fields of the PHY header, depending on the type of PPDU (e.g., OFDM, HT, VHT, HE). The receiver uses these bits to determine how to decode and demodulate the rest of the PPDU. The other options are not correct, as they are not communicated by bits in the PHY header. SNR (Signal-to-Noise Ratio), noise, and signal strength are measured by the receiver based on its own capabilities and environment. NEW QUESTION # 63

Prior to a retransmission what happens to the CWmax value?

- A. Doubles and increases by 1
- B. Set to the value of the AIFSN
- C. Reset to 0
- D. Increases by 1

Answer: A

Explanation:

Before a retransmission, the CWmax (Contention Window maximum) value doubles and increases by 1. The CWmax is a parameter that determines the upper limit of the random backoff time that a STA (station) has to wait before attempting to access the medium. The random backoff time is chosen from a range of values between CWmin (Contention Window minimum) and CWmax. The CWmin and CWmax values depend on the AC (Access Category) of the traffic and the PHY type of the STA. If a transmission fails due to a collision or an error, the STA has to retransmit the frame after waiting for another random backoff time. However, to reduce the probability of another collision, the STA increases its CWmax value by doubling it and adding 1.

This increases the range of possible backoff values and spreads out the STAs more evenly. The STA resets its CWmax value to its original value after a successful transmission or after reaching a predefined limit.
