### NEW QUESTION # 27

What is the default exposed LUN0 used for?

- A. vVol protocol endpoint
- **B. Storage Array Controller Device**
- C. Internal migration reserve LUN
- D. NVMe Discovery Controller

#### Answer: B

Explanation:

LUN 0 and the Storage Array Controller Device (SACD)

In PowerStore, LUN 0 has a specific and important function: it's used for the Storage Array Controller Device (SACD).

SACD: The SACD is a virtual device that provides access to the PowerStore appliance's internal management and control functions. It's essential for tasks like: Monitoring the health and status of the array Managing and configuring storage resources Troubleshooting issues LUN 0 as the Access Point: LUN 0 serves as the access point to the SACD. It allows authorized users and management tools to communicate with the SACD and perform necessary management operations.

Why other options are incorrect:

B). vVol protocol endpoint: PowerStore uses LUNs 254 and 255 for the vVol (vSphere Virtual Volumes) protocol endpoint.

C). Internal migration reserve LUN: PowerStore doesn't use a specific LUN for internal migration reserves. Migration operations utilize the cluster network and available storage resources dynamically.

D). NVMe Discovery Controller: NVMe discovery in PowerStore doesn't rely on a dedicated LUN. It uses standard NVMe-oF discovery mechanisms over the network. Important Notes Not a Typical LUN: LUN 0 is not a standard LUN that can be used for storing data. It's a specialized LUN dedicated to the SACD.

Automatic Exposure: PowerStore exposes LUN 0 by default. You don't need to manually create or configure it.

Dell PowerStore Reference

PowerStore: Host Configuration Guide: This guide provides information about connecting hosts to PowerStore, including details about specialized LUNs like the SACD. You can find the latest version of this guide on the Dell Support site.
