Quiz Amazon - Accurate AWS-Developer - Interactive AWS Certified

Developer Associate Exam (DVA-C02) Practice Exam

Our AWS-Developer exam prep is elaborately compiled and highly efficiently, it will cost you less time and energy, because we shouldn't waste our money on some useless things. The passing rate and the hit rate are also very high, there are thousands of candidates choose to trust our AWS-Developer guide torrent and they have passed the exam. We provide with candidate so many guarantees that they can purchase our study materials no worries. So we hope you can have a good understanding of the AWS-Developer Exam Torrent we provide, then you can pass your exam in your first attempt.

The AWS Certified Developer - Associate Exam covers a wide range of topics, including AWS services, compute, storage, networking, databases, security, and application integration. AWS-Developer exam consists of 65 multiple-choice questions, and candidates are given 130 minutes to complete the exam. AWS-Developer Exam is available in multiple languages, including English, Japanese, Korean, and Simplified Chinese.

Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q310-Q315):

NEW QUESTION # 310

An organization is storing large files in Amazon S3, and is writing a web application to display meta-data about the files to end-users. Based on the metadata a user selects an object to download. The organization needs a mechanism to index the files and provide single-digit millisecond latency retrieval for the metadata.

What AWS service should be used to accomplish this?

- A. Amazon EC2
- B. AWS Lambda
- C. Amazon DynamoDB
- D. Amazon RDS

Answer: C

Explanation:

Amazon DynamoDB is a fast and flexible NoSQL database service for all applications that need consistent, single-digit millisecond latency at any scale. It is a fully managed database and supports both document and key-value data models. Its flexible data model and reliable performance make it a great fit for mobile, web, gaming, ad-tech, Internet of Things (IoT), and many other applications.

NEW QUESTION # 311

A developer is working on an AWS Lambda function that accesses Amazon DynamoDB. The Lambda function must retrieve an item and update some of its attributes, or create the item if it does not exist. The Lambda function has access to the primary key. Which IAM permissions should the developer request for the Lambda function to achieve this functionality?

- A.
- B.
- C.
- D.

Answer: A

Explanation:

Requirement Summary:

* Lambda function:

* Retrieves an item from DynamoDB

* Updates its attributes or creates it if it does not exist

* Has primary key

* Needs minimum required IAM permissions

Analysis of Required Permissions:

To get an item and update it or create it if it doesn't exist, the Lambda function must use the ****PutItem**** or ****UpdateItem**** API, and read with ****GetItem****.

Valid API options:

* GetItem: Read the item from the table.

* UpdateItem: Update existing item attributes or insert if it doesn't exist (with UpdateExpression and ConditionExpression).

* When UpdateItem is used without a conditional check for existence, it can create a new item if it does not exist (acts like upsert).

* DescribeTable: (Optional) Used if you need table metadata (not strictly required here).

Evaluate the Choices:

Option A:

* DeleteItem - # Not needed

* GetItem - #

* PutItem - # (can create/replace but not partial update)

Close, but PutItem overwrites the full item, not update-in-place. Acceptable, but UpdateItem is better suited.

Option B:

* UpdateItem - # Required to modify attributes or insert new item

* GetItem - # Required to check existence or read data

* DescribeTable - # Optional, but not harmful

BEST FIT - Matches the update-or-create logic.

Option C:

* GetRecords - # This is used for DynamoDB Streams, not standard GetItem

* PutItem - #

* UpdateTable - # Used to change table settings, not data manipulation

Incorrect usage context

Option D:

* UpdateItem, GetItem, PutItem - # all valid

But UpdateItem alone is sufficient; including PutItem might not be necessary Also, image is faded (possibly invalid), and it's redundant

* UpdateItem API: https://docs.aws.amazon.com/amazondynamodb/latest/APIReference/API_UpdateItem.html

* PutItem vs UpdateItem: <https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/WorkingWithItems.html>

* IAM actions for DynamoDB: https://docs.aws.amazon.com/service-authorization/latest/reference/list_amazondynamodb.html

NEW QUESTION # 312

A company uses Amazon DynamoDB for managing and tracking orders. The DynamoDB table is partitioned based on the order date. The company receives a huge increase in orders during a sales event, causing DynamoDB writes to throttle, and the consumed throughput is far below the provisioned throughput.

According to AWS best practices, how can this issue be resolved with MINIMAL costs?

- A. Increase the read and write capacity units of the DynamoDB table.
- B. Create a new DynamoDB table for every order date.
- C. Add a random number suffix to the partition key values.
- D. Add a global secondary index to the DynamoDB table.

Answer: C

NEW QUESTION # 313

A developer is building a web application that uses Amazon API Gateway to expose an AWS Lambda function to process requests from clients. During testing, the developer notices that the API Gateway times out even though the Lambda function finishes under the set time limit.

Which of the following API Gateway metrics in Amazon CloudWatch can help the developer troubleshoot the issue? (Choose two.)

- A. CacheHitCount
- B. CacheMissCount
- C. IntegrationLatency
- D. Count
- E. Latency

Answer: C,E

Explanation:

Amazon API Gateway is a service that enables developers to create, publish, maintain, monitor, and secure APIs at any scale.

Amazon CloudWatch is a service that monitors AWS resources and applications. API Gateway provides several CloudWatch

metrics to help developers troubleshoot issues with their APIs. Two of the metrics that can help the developer troubleshoot the issue

of API Gateway timing out are:

* **IntegrationLatency**: This metric measures the time between when API Gateway relays a request to the backend and when it receives a response from the backend. A high value for this metric indicates that the backend is taking too long to respond and may cause API Gateway to time out.

* **Latency**: This metric measures the time between when API Gateway receives a request from a client and when it returns a response to the client. A high value for this metric indicates that either the integration latency is high or API Gateway is taking too long to process the request or response.

NEW QUESTION # 314

Regarding Amazon SNS, when you want to subscribe to a topic and receive notifications to your email, in the Protocol drop-down box, you should select _____.

- A. IMAP
- B. SMTP
- C. Email
- D. Message

Answer: C

Explanation:

In Amazon SNS, when you want to subscribe to a topic and receive notifications to your email, select Email in the Protocol drop-down box. Enter an email address you can use to receive the notification in the Endpoint field.

<http://docs.aws.amazon.com/sns/latest/dg/SubscribeTopic.html>
