

Best Quality UiPath UiPath-ADAv1 Exam Questions

BTW, DOWNLOAD part of Exam4Labs UiPath-ADAv1 dumps from Cloud Storage: https://drive.google.com/open?id=16na5bprhTd_M7-LHnEGowif7araB34F4

The advent of our UiPath UiPath-ADAv1 study guide with three versions has helped more than 98 percent of exam candidates get the certificate successfully. Rather than insulating from the requirements of the UiPath Automation Developer Associate v1 Exam UiPath-ADAv1 Real Exam, our UiPath-ADAv1 practice materials closely co-related with it.

UiPath UiPath-ADAv1 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Debugging: Here, we explore various debugging techniques, including debug modes, actions, and ribbon options. It also guides users through setting breakpoints, utilizing debugging panels, and optimizing performance with profile execution.
Topic 2	<ul style="list-style-type: none"> • Studio Interface: Here, the topic guides users through installing Studio Community Edition and connecting to Orchestrator. It covers profile differences, backstage view options, compatibility modes, and package management. Additionally, it offers an in-depth exploration of the Studio interface and its various elements.
Topic 3	<ul style="list-style-type: none"> • Libraries and Templates: This topic covers the creation, publication, and consumption of process libraries, along with the sharing and access of templates, promoting efficient project development and standardization.
Topic 4	<ul style="list-style-type: none"> • Workflow Analyzer: Here, the topic introduces the Workflow Analyzer tool, explaining its use for project analysis and validation, and providing guidance on configuring its settings.
Topic 5	<ul style="list-style-type: none"> • Exception Handling: This topic focuses on error management, showcasing the use of Try Catch, Throw, and Rethrow activities, along with the Retry Scope feature, to handle exceptions gracefully.
Topic 6	<ul style="list-style-type: none"> • Business Knowledge: This topic covers the fundamental concepts of business process automation, highlighting its value proposition. It also explores key ideas related to business processes, offering a comprehensive understanding of this domain.
Topic 7	<ul style="list-style-type: none"> • Logging: The section provides insights into interpreting robot execution logs and adhering to logging best practices, ensuring effective issue identification and resolution.
Topic 8	<ul style="list-style-type: none"> • PDF Automation: The section focuses on data extraction from native and scanned PDFs, including single and multiple document scenarios.
Topic 9	<ul style="list-style-type: none"> • Email Automation: This topic covers retrieving emails via IMAP • POP3, sending SMTP messages, and managing integrations with Microsoft and Gmail accounts, utilizing their respective packages.
Topic 10	<ul style="list-style-type: none"> • Variables and Arguments: This topic introduces data types and delves into creating, managing, and utilizing variables, arguments, and global constants • variables. It also clarifies the distinctions between these concepts, ensuring a comprehensive understanding of data handling in automation projects.

Topic 11	<ul style="list-style-type: none"> • Version Control Integration: The section highlights the benefits of version control by demonstrating the use of Studio's Git integration for adding projects, cloning repositories, committing changes, and managing branches.
Topic 12	<ul style="list-style-type: none"> • Excel Automation: The section delves into Excel Automation, showcasing the use of modern Excel activities and workbook-level operations.
Topic 13	<ul style="list-style-type: none"> • Working with Files and Folders: Here, you explore creating, managing, and navigating local files and folders, providing a foundation for file system automation.
Topic 14	<ul style="list-style-type: none"> • Integration Service: The section introduces Integration Service, explaining its purpose and demonstrating the use of connectors and triggers in automation projects to interact with external systems.
Topic 15	<ul style="list-style-type: none"> • Implementation Methodology: The section offers an overview of project implementation stages, interpretation of PDDs and SDDs, and the conduct of automation project peer reviews, ensuring a structured approach to development.
Topic 16	<ul style="list-style-type: none"> • Control Flow: The section explains the functionality of control flow activities and their impact on workflow types. It covers the use of sequence and flowchart layouts. Lastly, it focuses on implementing IF, For Each, and While activities, among others.

UiPath-ADAv1 Test Centres & UiPath-ADAv1 Exam Test

Our online staff is professionally trained and they have great knowledge on the UiPath-ADAv1 study guide. So they can clearly understand your requirements and ideas and then help you make the right choices. When you have purchased our UiPath-ADAv1 exam practice, but you do not know how to install it, we can also provide remote guidance to help you complete the installation. All in all, we will always be there to help you until you pass the UiPath-ADAv1 Exam and get a certificate.

UiPath Automation Developer Associate v1 Exam Sample Questions (Q301-Q306):

NEW QUESTION # 301

How should the computation of the signature be done for client apps that receive Orchestrator requests and need to check their authenticity?

Instructions: Drag the Description found on the left and drop on the correct Step Sequence found on the right.

Answer:

Explanation:

□ Explanation

□ A screenshot of a computer Description automatically generated

□ The correct sequence for the computation of the signature for client apps that receive Orchestrator requests and need to check their authenticity is:

Retrieve the X-UiPath-Signature HTTP header. This header contains the signature of the request body, encoded in Base64. (UiPath Orchestrator documentation) To obtain the raw signature bytes, decode the value of the header from Base64. You can use any tool or library that supports Base64 decoding. (UiPath Orchestrator documentation) Compute the hash using SHA256 and the signing key (UTF-8 encoded). The signing key is a secret value that is shared between Orchestrator and the client app. You can use any tool or library that supports SHA256 hashing. (UiPath Orchestrator documentation) Compare the computed signature to the value from X-UiPath-Signature HTTP header. If they match, then the request is authentic and has not been tampered with. If they do not match, then the request is invalid and should be rejected. (UiPath Orchestrator documentation) References:

NEW QUESTION # 302

The following table is stored in a variable called "dt".

What will the value of the qty variable be after executing the Assign activity?

- A. 0
- B. 1
- C. null
- **D. 2**

Answer: D

Explanation:

Explanation

The Assign activity is used to assign a value to a variable. In this case, the variable is "qty". The value of the variable will be 80 after executing the Assign activity because the expression in the Assign activity is

"dt.AsEnumerable().Where(Function(x) x("Item").ToString.Equals("mango")).Select(Function(y) y("Quantity")).ToString". This expression is filtering the data table "dt" for rows where the "Item" column is equal to "mango" and then selecting the "Quantity" column from those rows. Since there is only one row in the data table where "Item" is equal to "mango", the value of the "Quantity" column in that row is 80. (UiPath Studio documentation)

NEW QUESTION # 303

A developer wants to add items to a list of strings using the Invoke Method activity. The list is declared as follows:

Based on the information shown in the exhibits, what is the outcome of the Invoke Method activity?

- A. Colors will contain an item with an empty value.
- B. An exception will be thrown.
- C. Colors will contain an item with the value "Colors: Yellow".
- **D. Colors will contain an item with the value "Yellow".**

Answer: D

Explanation:

The Invoke Method activity is used to add items to a list of strings. In this case, the list is declared as "Colors".

The outcome of the Invoke Method activity will be that the list "Colors" will contain an item with the value

"Yellow". This is because the TargetObject property is set to "Colors", which is the list variable, the MethodName property is set to "Add", which is the method of the list class, and the Parameters property is set to "Yellow", which is the value to be added to the list. (UiPath Studio documentation) References:

1: Invoke Method - UiPath Activities.

NEW QUESTION # 304

How should the computation of the signature be done for client apps that receive Orchestrator requests and need to check their authenticity?

Instructions: Drag the Description found on the left and drop on the correct Step Sequence found on the right.

Answer:

Explanation:

Explanation:

The correct sequence for the computation of the signature for client apps that receive Orchestrator requests and need to check their authenticity is:

* Retrieve the X-UiPath-Signature HTTP header. This header contains the signature of the request body, encoded in Base64.

(UiPath Orchestrator documentation)

* To obtain the raw signature bytes, decode the value of the header from Base64. You can use any tool or library that supports Base64 decoding. (UiPath Orchestrator documentation)

* Compute the hash using SHA256 and the signing key (UTF-8 encoded). The signing key is a secret value that is shared between Orchestrator and the client app. You can use any tool or library that supports SHA256 hashing. (UiPath Orchestrator documentation)

* Compare the computed signature to the value from X-UiPath-Signature HTTP header. If they match, then the request is authentic and has not been tampered with. If they do not match, then the request is invalid and should be rejected. (UiPath Orchestrator documentation1) References:

* 1: Webhooks - UiPath Orchestrator.

NEW QUESTION # 305

What is the output type returned when using a Get Test Data Queue Item activity?

- A. Object
- B. QueueItem
- C. Dictionary
- D. Dictionary

Answer: C

Explanation:

The Get Test Data Queue Item activity is used to retrieve a test data queue item from Orchestrator and store it in a variable. The output type of the variable is Dictionary, which means that it is a collection of key-value pairs that can be accessed by using the key name. For example, if the test data queue item contains the fields Name, Age, and Gender, then the output variable can be used to get the values of these fields by using expressions like `outputVar("Name")`, `outputVar("Age")`, or `outputVar("Gender")`. (UiPath Studio documentation1) References:
