CompTIA 220-1102 Pdf Pass Leader & Valid 220-1102 Exam Tips

As a working person, the CompTIA 220-1102 practice exam will be a great help because you are left with little time to prepare for the CompTIA 220-1102 certification exam which you cannot waste to make time for the CompTIA 220-1102 Exam Questions. You can find yourself sitting in your dream office and enjoying the new opportunity.

CompTIA A+ Certification Exam: Core 2 Sample Questions (Q48-Q53):

NEW QUESTION # 48
A technician has been tasked with using the fastest and most secure method of logging in to laptops. Which of the following log-in options meets these requirements?

- A. Username and password
- B. PIN
- C. SSO
- D. Fingerprint

Answer: B

NEW QUESTION # 49

A user's mobile phone battery does not last long and navigation is very slow. Which of the following should the technician do first to resolve the issue?

- A. Update the mobile OS
- B. Check running applications
- C. Disable network services
- D. Uninstall unused programs

Answer: B

Explanation:
Detailed
The first step is to check running applications (Option B). Applications running in the background could consume a lot of battery and processing power, causing slow performance and battery drain. By identifying and closing or uninstalling these apps, the technician can resolve the issue more effectively.
Uninstalling unused programs (Option A) might help, but checking active applications is more immediate.
Updating the mobile OS (Option C) can improve performance but is not the first step in this scenario.
Disabling network services (Option D) might help reduce battery drain but does not address potential app-related issues.
CompTIA A+ Core 2 Reference:
3.4 - Troubleshoot common mobile OS and application issues, including battery and performance concerns.

NEW QUESTION # 50

A hotel's Wi-Fi was used to steal information on a corporate laptop. A technician notes the following security log:
SRC: 192.168.1.1/secrets.zip Protocol SMB >> DST: 192.168.1.50/capture
The technician analyses the following Windows firewall information:
□
Which of the following protocols most likely allowed the data theft to occur?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: B

Explanation:
The protocol that most likely allowed the data theft to occur is SMB over TCP port 445. SMB is a network file sharing protocol that enables access to files, printers, and other resources on a network. Port 445 is used by SMB to communicate directly over TCP without the need for NetBIOS, which is an older and less secure protocol. The security log shows that the source IP address 192.168.1.1 sent a file named secrets.zip using SMB protocol to the destination IP address 192.168.1.50, which captured the file. The Windows firewall information shows that port 445 is enabled for inbound and outbound traffic, which means that it is not blocked by the firewall. Therefore, port 445 is the most likely port that was exploited by the attacker to steal the data from the corporate laptop.

NEW QUESTION # 51

A user's workstation was infected with a newly discovered virus that the AV system detected. After a full virus scan and a

workstation reboot, the virus is still present in the OS. Which of the following actions should the user take to remove the virus?

- A. Run the operating system update process.
- B. Use bootable antivirus media to scan the system.
- C. Download software designed to specifically target the virus.
- D. Enable the system firewall.

Answer: B

Explanation:
Using bootable antivirus media to scan the system is an effective method for removing a persistent virus. Booting from external antivirus media allows the system to scan for and remove malware without the infected operating system running, which can prevent the virus from hiding or resisting removal efforts that might occur within the active OS environment.

NEW QUESTION # 52

A technician is trying to connect to a user's laptop in order to securely install updates. Given the following information about the laptop:
Which of the following should the technician do to connect via RDP?

- A. Change the IP address on the user's laptop.
- B. Change the subnet mask on the user's laptop.
- C. Open port 3389 on the Windows firewall.
- D. Confirm the user can ping the default gateway.

Answer: C

Explanation:
In order to connect to a user's laptop via RDP, the technician should open port 3389 on the Windows firewall. This is because RDP uses port 3389 for communication12. The other options are not necessary or relevant for establishing an RDP connection.
Confirming the user can ping the default gateway is not required for RDP, as it only tests the network connectivity between the user's laptop and the router. RDP works over the internet, so the technician should be able to ping the user's laptop directly using its IP address3.
Changing the IP address on the user's laptop is not needed for RDP, as long as the IP address is valid and not conflicting with another device on the network. The user's laptop has a valid IP address of 192.168.0.45, which belongs to the same subnet as the gateway (192.168.0.1) and the subnet mask (255.255.255.0)4.
Changing the subnet mask on the user's laptop is not required for RDP, as long as the subnet mask matches the network configuration. The user's laptop has a correct subnet mask of 255.255.255.0, which defines a network with 254 possible hosts4.
