VMware Advanced VMware Cloud Foundation 9.0 vSphere Kubernetes Service Sample Questions (Q35-Q40):

NEW QUESTION # 35
A Cloud Architect is designing an upgrade strategy for a multi-site VKS environment with Federation.
Scenario:
Site A and Site B both have Supervisor Clusters. Site A hosts the "Global" Harbor Registry. Site B's TKG clusters pull images from Site A's Harbor.
The architect plans to upgrade Site A's Supervisor.
Which dependency/risk must be mitigated during the upgrade plan? (Choose 2.)

- A. The Harbor service on Site A must be migrated to a standalone VM before the upgrade.
- B. Site B must be upgraded before Site A to maintain backward compatibility.
- C. If the upgrade of Site A involves downtime for the Harbor Supervisor Service (e.g., due to a breaking change or restart), Site B's clusters will be unable to pull new images (ImagePullBackOff).
- D. Ensure that the Tanzu Kubernetes Releases (TKRs) available in Site B are compatible with the new Supervisor version in Site A if Site A is the content source.
- E. Upgrading the Supervisor deletes all data in the Harbor registry.

Answer: C,D

NEW QUESTION # 36

An administrator has been tasked to temporarily scale the Control Plane of a VKS cluster with no service disruption. How should the administrator accomplish this task?

- A. Edit the cluster.yaml file to change the number of Control Plane replicas.
- B. Create a new namespace with the desired number of Control Plane nodes.
- C. Delete and redeploy the cluster with the desired number of Control Plane nodes.
- D. Create a new cluster in the namespace with the requested number of nodes.

Answer: A

Explanation:

VKS cluster lifecycle is managed using a declarative API: you use kubectl with a YAML file to specify the desired state of the cluster (for example: "how many nodes," Kubernetes version, sizing, and storage). After the cluster is created, you update the YAML to update the cluster. This is why the correct operational approach is to modify the cluster manifest (cluster.yaml) rather than deleting and redeploying.

Additionally, VKS uses multiple controller layers, where Cluster API and the Virtual Machine Service are responsible for provisioning and managing the lifecycle of the control plane and worker node VMs that make up the VKS cluster. In other words, when you change the declared state for control plane sizing/replica count in the cluster YAML, the platform reconciles to that new state by adjusting the underlying control plane VMs through the supported controllers, instead of requiring disruptive "tear down and rebuild" operations.

So, editing the cluster.yaml to adjust the control plane replica count is the method that matches the documented VKS declarative operations model and controller-driven reconciliation.

NEW QUESTION # 37

Which characteristic distinguishes a vSphere Pod from a standard virtual machine in a vSphere with Tanzu environment?

- A. A vSphere Pod cannot be managed via the vSphere Client and is only visible via kubectl.
- B. A vSphere Pod requires a pre-existing Tanzu Kubernetes Grid cluster to be deployed.
- C. A vSphere Pod runs directly on the ESXi host using a lightweight generic kernel (CRX) optimized for containers.
- D. A vSphere Pod runs a full heavy-weight guest operating system (Linux/Windows) managed by the tenant.

Answer: C

NEW QUESTION # 38

A Platform Engineer needs to configure a vSphere Namespace to allow a specific Active Directory group, dev-admins@corp.local, to have full administrative access to the Kubernetes namespace, including the ability to create and delete TKG clusters. The solution must follow the principle of least privilege within vSphere.

Which configuration steps in the vSphere Client will achieve this? (Select all that apply.)

- A. In the Namespace permissions, add dev-admins@corp.local with the Owner role.
- B. Ensure the Identity Source corp.local is configured in vCenter Single Sign-On.
- C. Assign the NSX Administrator role to dev-admins@corp.local in NSX Manager.
- D. Assign the Administrator role to dev-admins@corp.local at the vCenter Server Global Permissions level.
- E. In the Namespace permissions, add dev-admins@corp.local with the CanEdit role.

Answer: A,B

NEW QUESTION # 39

A Platform Engineer attempts to create a snapshot of a PVC named mysql-data but the VolumeSnapshot object remains in a ReadyToUse: False state.

The engineer inspects the status:

$ kubectl describe volumesnapshot mysql-snap

...

Status:
Ready To Use: false
Error: Snapshot creation failed: Error: CNS: CnsVolumeNotFound
What is the most likely cause of this error? (Choose 2.)

- A. The PVC mysql-data is currently mounted by a running Pod, and the vSphere CSI driver (in certain versions/configurations) or the specific filesystem requires the volume to be quiesced or unmounted (or the FCD ID is missing/mismatched).
- B. The VolumeSnapshotClass specified does not exist.
- C. The Namespace quota for snapshots has been exceeded.
- D. The virtual disk (VMDK) associated with the PV was manually moved to a different datastore using Storage vMotion without updating the CNS metadata.
- E. The underlying Persistent Volume (PV) backing the PVC mysql-data has been deleted or detached from the CNS (Cloud Native Storage) perspective in vSphere.

Answer: D,E
