NEW QUESTION # 179

What is the function of the external ID when onboarding a new Amazon Web Services (AWS) account in Prisma Cloud?

- A. It is the default name of the PrismaCloudApp stack.
- B. It is the resource name for the Prisma Cloud Role.
- C. It is a unique identifier needed only when Monitor & Protect mode is selected.
- D. It is a UUID that establishes a trust relationship between the Prisma Cloud account and the AWS account in order to extract data.

Answer: D

Explanation:

The external ID plays a crucial role when onboarding a new Amazon Web Services (AWS) account in Prisma Cloud. It serves as a UUID (Universally Unique Identifier) that establishes a trust relationship between the Prisma Cloud account and the AWS account. This trust relationship is essential for allowing Prisma Cloud to securely extract data and perform security monitoring and compliance checks within the AWS environment.

The use of an external ID ensures that Prisma Cloud can access the necessary information from the AWS account without compromising the security of the AWS account's credentials, adhering to the principle of least privilege and enhancing the overall security posture.

NEW QUESTION # 180

Which three OWASP protections are part of Prisma Cloud Web-Application and API Security (WAAS) rule? (Choose three.)

- A. Shellshock
- B. DoS Protection
- C. Suspicious binary
- D. SQL injection
- E. Local file inclusion

Answer: A,D,E

Explanation:

In the Prisma Cloud Web-Application and API Security (WAAS) rules, protections against OWASP- recognized vulnerabilities like Local file inclusion, SQL injection, and Shellshock are included. Local file inclusion involves unauthorized access to files on the

server, potentially leading to sensitive information disclosure. SQL injection targets data-driven applications by inserting malicious SQL statements into an entry field, while Shellshock exploits vulnerabilities in Bash, a widely used Unix shell, to execute arbitrary commands. These protections are part of Prisma Cloud's comprehensive approach to securing web applications and APIs against common and severe vulnerabilities.

inwidth=3840 OWASP Top-10 Coverage - Protection against most critical security risks to web applications, including injection flaws, broken authentication, broken access control, security misconfigurations, etc.

NEW QUESTION # 181

Which two statements are true about the differences between build and run config policies? (Choose two.)

- A. Build and Audit Events policies belong to the configuration policy set.
- B. Build policies enable you to check for security misconfigurations in the IaC templates and ensure that these issues do not get into production.
- C. Run policies monitor network activities in your environment, and check for potential issues during runtime.
- D. Run policies monitor resources, and check for potential issues after these cloud resources are deployed.
- E. Run and Network policies belong to the configuration policy set.

Answer: B,D

Explanation:

In the context of Prisma Cloud, Build and Run policies serve distinct purposes in securing cloud environments. Build policies are designed to evaluate Infrastructure as Code (IaC) templates before deployment. These policies help identify and remediate security misconfigurations in the development phase, ensuring that vulnerabilities are addressed before the infrastructure is provisioned. This proactive approach enhances security by preventing misconfigurations from reaching production environments.

On the other hand, Run policies are applied to resources that are already deployed in the cloud. These policies continuously monitor the cloud environment, detecting and alerting on potential security issues that arise in the runtime. Run policies help maintain the security posture of cloud resources by identifying deviations from established security baselines and enabling quick remediation of identified issues.

Both Build and Run policies are integral to a comprehensive cloud security strategy, addressing security concerns at different stages of the cloud resource lifecycle—from development and deployment to ongoing operation.

NEW QUESTION # 182

Which three types of buckets exposure are available in the Data Security module? (Choose three.)

- A. Public
- B. Differential
- C. Conditional
- D. Private
- E. International

Answer: A,C,D

Explanation:

In the Data Security module of cloud security platforms like Prisma Cloud, the types of bucket exposures typically include Public (option A), Private (option B), and Conditional (option E). Public buckets are accessible by anyone on the internet, posing a significant data leakage risk. Private buckets are restricted to authorized users only, offering a higher level of security. Conditional exposure involves buckets that may be accessible under certain conditions or to specific users, requiring careful configuration and policy enforcement to prevent unauthorized access. International (option C) and Differential (option D) do not represent standard types of bucket exposures in cloud security contexts.
