About the upcoming UiPath-ADAv1 exam, do you have mastered the key parts which the exam will test up to now? Everyone is conscious of the importance and only the smart one with smart way can make it. Maybe you are unfamiliar with our UiPath-ADAv1 Latest Material, but our UiPath-ADAv1 real questions are applicable to this exam with high passing rate up to 98 percent and over.

UiPath UiPath-ADAv1 Exam Syllabus Topics:

Topic	Details
Topic 1	• Working with Files and Folders: Here, you explore creating, managing, and navigating local files and folders, providing a foundation for file system automation.
Topic 2	• Implementation Methodology: The section offers an overview of project implementation stages, interpretation of PDDs and SDDs, and the conduct of automation project peer reviews, ensuring a structured approach to development.
Topic 3	• Control Flow: The section explains the functionality of control flow activities and their impact on workflow types. It covers the use of sequence and flowchart layouts. Lastly, it focuses on implementing IF, For Each, and While activities, among others.
Topic 4	• Debugging: Here, we explore various debugging techniques, including debug modes, actions, and ribbon options. It also guides users through setting breakpoints, utilizing debugging panels, and optimizing performance with profile execution.
Topic 5	• Logging: The section provides insights into interpreting robot execution logs and adhering to logging best practices, ensuring effective issue identification and resolution.
Topic 6	• Platform Knowledge: The section provides an overview of UiPath's product suite, including Studio and Robot variants, Orchestrator, and Integration Service, showcasing their unique contributions. It also emphasizes the benefits of Academy, Forum, and Marketplace in the UiPath ecosystem.
Topic 7	• Excel Automation: The section delves into Excel Automation, showcasing the use of modern Excel activities and workbook-level operations.
Topic 8	• Libraries and Templates: This topic covers the creation, publication, and consumption of process libraries, along with the sharing and access of templates, promoting efficient project development and standardization.

Topic 9	• Data Manipulation: This topic covers a range of data manipulation techniques, including string manipulation using VB.Net methods and the RegEx Builder. It also guides users through working with arrays, lists, and dictionaries, as well as building and iterating through DataTables.
Topic 10	• Studio Interface: Here, the topic guides users through installing Studio Community Edition and connecting to Orchestrator. It covers profile differences, backstage view options, compatibility modes, and package management. Additionally, it offers an in-depth exploration of the Studio interface and its various elements.

# Practice Exam Software UiPath UiPath-ADAv1 Dumps PDF

We provide UiPath UiPath-ADAv1 web-based self-assessment practice software that will help you to prepare for the UiPath certification exam. UiPath UiPath-ADAv1 Web-based software offers computer-based assessment solutions to help you automate the entire UiPath Automation Developer Associate v1 Exam testing procedure. The stylish and user-friendly interface works with all browsers, including Mozilla Firefox, Google Chrome, Opera, Safari, and Internet Explorer. It will make your certification exam preparation simple, quick, and smart. So, rest certain that you will discover all you need to study for and pass the UiPath UiPath-ADAv1 Exam on the first try.

UiPath Automation Developer Associate v1 Exam Sample Questions (Q269-Q274):
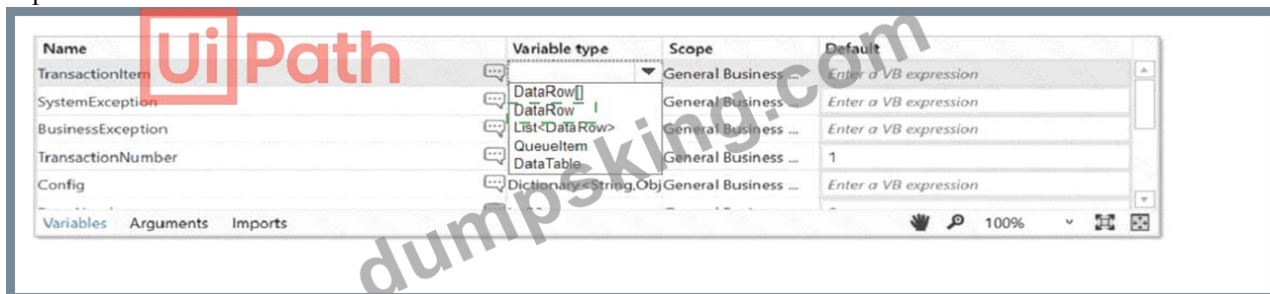

NEW QUESTION # 269
A developer aims to employ the REFramework for automating a business process that involves a TransactionData collection (DataTable) comprising vendor names and addresses.
Instructions: Choose the appropriate variable type for the TransactionItem from the provided drop-down list in the following exhibit.

Answer:

Explanation:

Explanation
DataRow
The REFramework is a template that provides a robust and scalable structure for building automation projects. It uses the concept of TransactionData and TransactionItem to handle the input data and process it in a loop1. The TransactionData is a collection of items that need to be processed, and the TransactionItem is a single item from that collection that is assigned to the robot in each iteration2.
The type of the TransactionItem variable depends on the type of the TransactionData variable. By default, the REFramework uses QueueItem as the type for both variables, assuming that the input data comes from an Orchestrator queue3. However, if the input data comes from a different source, such as an Excel file, a web page, or a SAP application, then the type of both variables needs to

be changed accordingly4.

In your case, since the input data is a DataTable that contains vendor names and addresses, the appropriate type for the TransactionItem variable is DataRow. A DataRow represents a single row in a DataTable, and it can store multiple values in its columns. By using DataRow as the type for the TransactionItem variable, you can access and manipulate the vendor information in each iteration of the process.

NEW QUESTION # 270

Which is an example of when an application might use a Scheduled Script Execution (Scheduled Job)?

- A. To display a custom welcome message when a user logs in.
- B. The application needs to query the database every day to look for unassigned records.
- C. To validate form input fields before a record is submitted.
- D. The application needs to run a client-side script at the same time every day.

Answer: B

Explanation:

Comprehensive and Detailed Explanation:

In ServiceNow, a Scheduled Script Execution, commonly referred to as a Scheduled Job, is a server-side script that runs at a specified time or on a recurring schedule. These are particularly useful for automating routine tasks, maintenance, or any activity that needs to occur at regular intervals without manual intervention.

* Option A (Incorrect): Displaying a custom welcome message when a user logs in is an action that occurs in real-time, triggered by the user's login event. This would typically be handled by a Login Interceptor or a client-side script, not by a Scheduled Job.

* Option B (Correct): Running a daily query to identify unassigned records is a classic use case for a Scheduled Job. By setting up a script to execute at a specific time each day, the system can automatically perform this database query and take appropriate actions, such as notifying users or reassigning tasks.

* Option C (Incorrect): Client-side scripts run in the user's browser and are designed to manage user interactions on forms and pages. Scheduling a client-side script to run at a specific time daily is not feasible, as it would require the user's browser to be active and the relevant page to be loaded at that exact time.

* Option D (Incorrect): Validating form input fields before submission is an immediate action that ensures data integrity and user feedback in real-time. This is typically managed by client-side scripts or UI policies that trigger upon form submission, not by Scheduled Jobs.
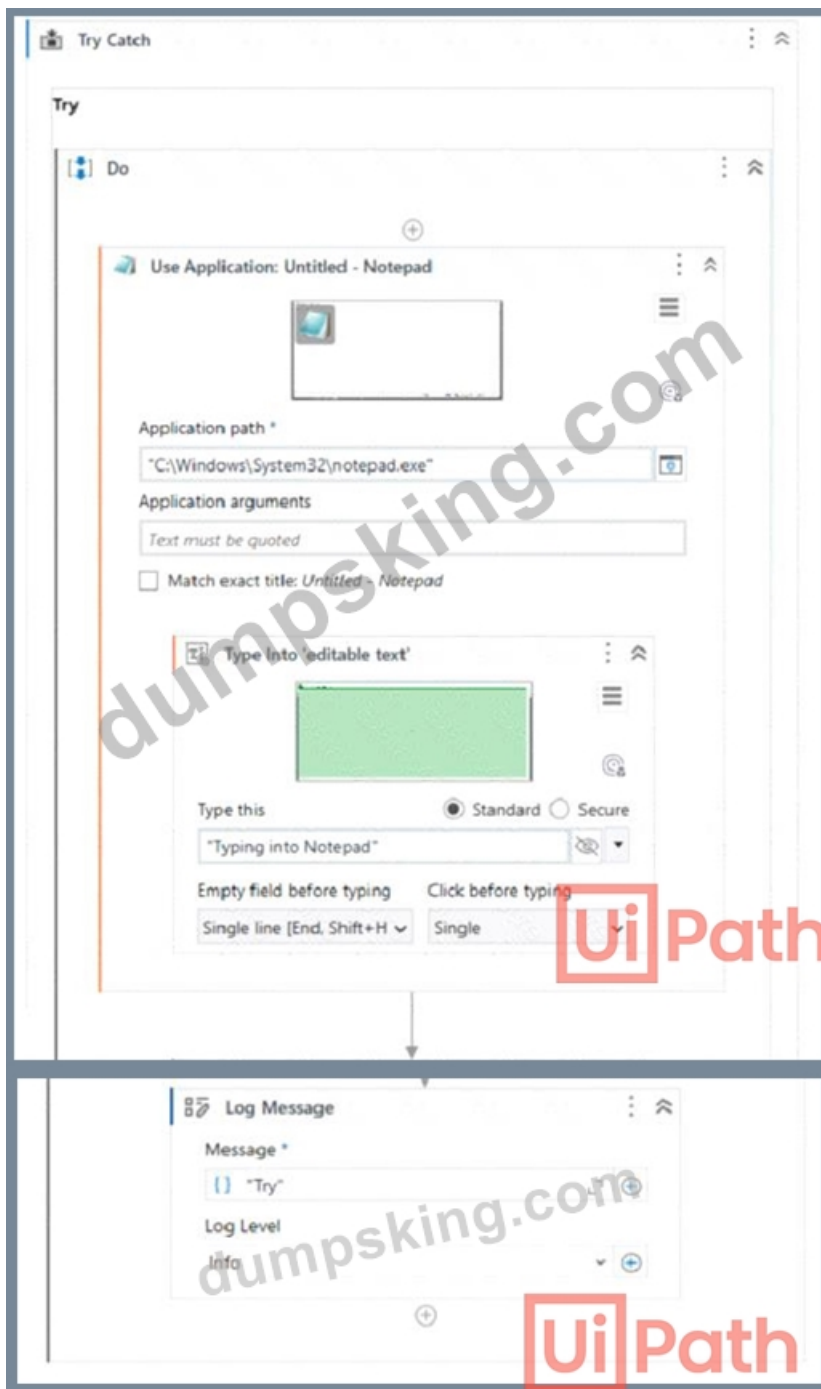

Therefore, the most appropriate scenario for using a Scheduled Script Execution is when an application needs to perform regular, automated tasks on the server side, such as querying the database daily for unassigned records.

If the automation is executed and Notepad.exe is not running, which Log Message text value is contained in the Output panel?

- A. SelectorNotFoundException
- B. Exception
- C. Try
- D. ApplicationNotFoundException

Answer: A

Explanation:
Based on the image you sent, the automation process consists of four steps: opening Notepad.exe, typing some text, saving the file, and closing Notepad.exe. Each step has a Log Message activity that writes a text value to the Output panel. If Notepad.exe is not running, the first step will fail and throw an exception. The exception type is SelectorNotFoundException, because the Open Application activity cannot find the selector for Notepad.exe1. Therefore, the Log Message text value that is contained in the Output panel is
"SelectorNotFoundException", which is option D.
References: Open Application documentation.

NEW QUESTION # 272
In a process, a variable called 'Timestamp' of type DateTime is used. The developer wants to print the variable in the format "yyyy-MM-dd hh:mm".
Which expression should be used?

- A. Timestamp.ToString("yyyy-MM-dd hh:mm")
- B. Timestamp."dd-MM-yyyy"

- C. Timestamp.ToString(), "yyyy-MM-dd hh:mm"
- D. Timestamp.ToDateTime("yyyy-MM-dd hh:mm")

Answer: A

Explanation:
Comprehensive and Detailed In-Depth Explanation:
In UiPath, ToString() is used to format DateTime variables into custom formats.
Correct Usage:
vb
CopyEdit
Timestamp.ToString("yyyy-MM-dd hh:mm")
# This formats the DateTime into "Year-Month-Day Hour:Minute" format.
Step-by-Step Execution Guide: Formatting Dates in UiPath
1## Assign a DateTime Variable:
vb
CopyEdit
Dim Timestamp As DateTime = Now
2## Format it to a Custom String:
vb
CopyEdit
Log Message: Timestamp.ToString("yyyy-MM-dd hh:mm")
Example Output: "2024-02-25 08:30"
This is commonly used for logging and reporting!
Reference:
* UiPath Documentation: Working with DateTime

NEW QUESTION # 273

A project built using REFramework pulls phone numbers from a database of employees and creates queue items for each one. Following processing, these elements must be added to a financing application. The queue item holding a phone number becomes invalid if a digit is accidentally left out because of a human mistake. As a requirement, queue items that contain partial numbers should not be accepted.
What type of error should be thrown according to best practices?

- A. Application Exception
- B. System Exception
- C. Fatal Exception
- D. Business Exception

Answer: D

Explanation:
Explanation
A business exception is an exception that occurs due to a fault in the business process logic or data, such as invalid input, incorrect format, missing information, etc. Business exceptions are usually predictable and can be handled gracefully by logging the error and moving to the next transaction. In this case, a queue item that contains a partial phone number is an example of a business exception, as it is caused by a human mistake and does not affect the functionality of the application or system.
