## SAP C\_CPI\_2506復習範囲 & C\_CPI\_2506日本語版

C\_CPI\_2506準備急流はタイミング機能を高め、内容は理解しやすく、重要な情報を簡素化しました。C\_CPI\_2506テストブレイクダンプは、より重要な情報をより少ない回答と質問で伝え、学習をリラックスして効率的にします。試験に不合格になった場合は、すぐに返金されます。SAPすべてのC\_CPI\_2506試験トレントは、C\_CPI\_2506試験に簡単かつ正常に合格するために多くの助けを与えます。C\_CPI\_2506試験問題を試してみてください。どれだけ優れているかわかります。

## SAP Certified Associate - Integration Developer 認定 C\_CPI\_2506 試験問題 (Q47-Q52):

### 質問 # 47

You want to send messages over an SOAP adapter to an integration flow. Which method do you use to send the messages?

- A. POST
- B. GET
- C. PATCH
- D. UPDATE

正解: A

解説:

To send messages over a SOAP adapter to an integration flow, you must use the POST method. The POST method is used to create or update a resource on the server using the SOAP message body as the input. The SOAP adapter supports both SOAP 1.1 and SOAP 1.2 protocols and can handle both one-way and request-reply message exchange patterns. The SOAP adapter can be configured as a sender or a receiver channel in an integration flow. Reference: SOAP (SOAP 1.x) Adapter | SAP Help Portal, SOAP Sender Adapter: Example Integration Flow | SAP Help Portal

### 質問 # 48

From which of the following can you create an API proxy directly?Note: There are 2 correct answers to this question.

- A. S/4HANA API
- B. Open Connectors
- C. API provider
- D. Source URL

正解: C、D

解説:

In SAP API Management (part of Integration Suite), an API Proxy acts as a façade for a backend service. You can create an API proxy directly from:

API Provider # An API provider represents the backend system (e.g., SAP S/4HANA, SAP Gateway, third-party services).

Proxies can be generated from these providers.

Source URL # You can directly specify the backend system's endpoint URL, and an API proxy will be generated from it.

Other options:

Open Connectors # Provides harmonized APIs to third-party apps (e.g., Salesforce, HubSpot), but you don't create proxies directly from them.

S/4HANA API # While S/4HANA APIs can be exposed, they are typically accessed via an API Provider or URL, not directly listed as a creation source.

#### 質問 # 49

What do you use in an integration flow to handle unexpected errors?

- **A. Exception-handling subprocesses**
- B. Status code checks
- C. Try-catch subprocesses
- D. Exception handler integration flow elements

正解: A

解説:

In SAP Cloud Integration (part of Integration Suite), error handling within integration flows is implemented using:

Exception Subprocesses # Dedicated subprocesses triggered by an Error Start Event to handle unexpected runtime exceptions. These allow logging, error notifications, or compensating logic.

Other options:

Try-Catch subprocesses # Not a modeling construct in SAP CPI.

Exception handler integration flow elements # Not a standard artifact; error handling is done with exception subprocesses.

Status code checks # Useful for response validation but not full error handling.

Thus, the correct answer is Exception-handling subprocesses.

#### 質問 # 50

How does the increased number of API calls in a microservices architecture impact API management and monitoring within an SAP Integration Suite landscape?

- A. Increased API calls improve API management efficiency and reduce the need for extensive monitoring within the SAP Integration Suite.
- B. Increased API calls necessitate less robust API management tools and simplified monitoring capabilities within the SAP Integration Suite.
- C. performance, security and traceability across the distributed microservices.
- D. Reduced API calls simplify API management and minimize monitoring needs within the SAP Integration Suite.
- **E. Increased API calls necessitate more robust API management tools and comprehensive monitoring capabilities within the SAP Integration Suite**

正解: E

解説:

In a microservices architecture, applications are decomposed into multiple smaller services communicating via APIs. This results in: Increased API traffic due to inter-service communication.

Higher need for governance: enforcing policies, security, throttling, and quotas.

Comprehensive monitoring required to trace calls across multiple distributed services to ensure performance, reliability, and compliance.

SAP Integration Suite's API Management provides these capabilities:

Traffic management (quotas, rate limiting).

Security policies (OAuth, API keys).

End-to-end monitoring & analytics for distributed calls.

Thus, the correct answer highlights the need for more robust API management and monitoring in high-volume, microservices-driven landscapes.

## 質問 #51

What can you use to prevent overload in an OData request and reply call?

- A. Stop parameter
- **B. Paging**
- C. Query filter
- D. HTTP adapter

**正解： B**

解説:

To prevent overload in an OData request and reply call, you can use paging. Paging is a technique that allows you to retrieve a large number of data sets in smaller chunks or pages. You can use the OData query options \$top and \$skip to specify how many records you want to fetch and how many records you want to skip in each request. This reduces the network load and improves the performance of the OData service. Reference: [OData API | SAP Help Portal](#), [SAP Integration Suite: enrich a payload with OData Service | SAP Blogs](#)
