EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q51-Q56):

NEW QUESTION # 51

Question:

What is a key benefit for deploying a remote data protection and recovery solution in a data center environment?

- A. Reduces the cost of protecting data
- **B. Maximizes application and information availability**
- C. Avoids security risks that expose business data
- D. Reduces required maintenance time for IT resources

Answer: B

Explanation:

Remote data protection and recovery solutions, like replication and cloud-based backup, are primarily designed to ensure maximum application and information availability. They protect data in the event of:

- * Local failures(disk, server, or site outages)
- * Natural disasters(floods, fires)
- * Ransomware attacks

By having off-site copies and failover options, businesses maintain continuous access to critical data.

NEW QUESTION # 52

Question:

In traditional provisioning, which two factors determine the availability, capacity, and performance of the RAID set?

- A. Capacity of drives
- **B. The RAID level**
- C. Make of drives
- **D. The number of drives in the RAID set**

Answer: B,D

Explanation:

In traditional storage provisioning, the RAID configuration significantly impacts the storage system's characteristics:

- * RAID Level: Determines data redundancy and fault tolerance. For example, RAID 1 mirrors data, providing high availability, while RAID 5 uses parity, balancing performance and redundancy.
- * Number of Drives: Affects both capacity and performance. More drives can increase total storage capacity and improve performance through parallel data access.
- * Make of Drives: While drive quality matters, it's less influential than RAID configuration in determining overall system characteristics.

* Capacity of Drives: Impacts total storage size but doesn't directly influence performance or availability as significantly as RAID level and drive count.

NEW QUESTION # 53

Question:

What is the most common technique used by malware protection software to detect malware?

- A. Reputation-based analysis
- B. Behavioral analysis
- C. Signature-based detection
- D. Heuristic analysis

Answer: C

Explanation:

Signature-based detection is the most common method of malware detection. It works by comparing files and data to a database of known malware signatures:

Fast and efficient for known threats.

Updated regularly by security vendors.

* Reputation-based: Looks at the trustworthiness of files/domains.

* Behavioral: Monitors actions and identifies suspicious patterns.

* Heuristic: Detects new malware based on file behaviors and patterns, useful for unknown threats.

Reference:Dell Information Storage and Management Foundations 2023 Study Guide, Section: Malware Detection Techniques.

NEW QUESTION # 54

Question:

A customer uses FCIP to connect local and remote FC SANs. The remote SAN is replicated to and used to store daily backup data. Latency over the IP WAN increases to unacceptable levels during peak replication periods. No other data transfer services using the WAN experience the same latency problem.

What is the likely cause of the data replication performance issue?

- A. IP packet segmentation
- B. FCIP gateway FC ports set to TE_Port mode
- C. Ethernet frame segmentation
- D. FCIP gateway FC ports set to EX_Port mode

Answer: A

Explanation:

IP packet segmentation can cause replication performance issues over the WAN.

Since FCIP tunnels FC frames over IP networks, if the IP packet size exceeds the MTU, packets are fragmented and reassembled, increasing latency.

* TE_Port mode is used for trunking, not related to packet fragmentation.

* EX_Port mode is used for inter-switch connectivity (FCR).

* Ethernet frame segmentation is not relevant in FCIP tunneling.

Reference:Dell Information Storage and Management Foundations 2023 Study Guide, Section: FCIP and IP WAN Connectivity.

NEW QUESTION # 55

Question:

A company is concerned about the risk of data loss due to accidental deletion and hardware failures. What is the primary reason for implementing a data backup solution?

- A. To maintain business continuity
- B. To improve application performance
- C. To reduce the usage of archive storage

- D. To reduce storage costs

Answer: A

Explanation:

The primary purpose of a data backup solution is to maintain business continuity by ensuring data can be restored in case of accidental deletion, hardware failure, or data corruption.

* Not to reduce storage costs: Archiving and tiering handle that.

* Not to improve application performance: Backup processes typically don't enhance live performance.

* Not to reduce archive usage: Backup and archive have different use cases.
