## Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q118-Q123):

### NEW QUESTION # 118

A user plans to use RDS as a managed DB platform. Which of the below mentioned features is not supported by RDS?

- A. Automated failure detection and recovery

- B. Automated software patching
- C. Automated backup
- D. **Automated scaling to manage a higher load**

**Answer: D**

#### NEW QUESTION # 119

An organization has enabled a strict password policy for its IAM users. The organization is taking help from the IAM console to set the password policy. Which of the below mentioned rules cannot be specified by the user as a part of the policy?

- A. Allow at least one lower case letter
- B. Allow at least one number
- C. Allow at least one non-alphanumeric character
- D. **Do not allow the user to use the password from the last three passwords**

**Answer: D**

Explanation:

AWS IAM allows an organization to create multiple users and provide them access to various AWS services. By default when the user is created, he does not have password enabled and can not login to AWS console. If the organization wants to allow the users to login to AWS console, they can enable password for each user. It is required that IAM users follow certain guidelines to set their IAM login password. For this IAM provides root account owner to setup password policy.

The password policy also lets the specify whether all IAM users can change their own passwords.

As part of policy, organization can specify that passwords for IAM users must be of a certain minimum length, must include certain characters, and a few more criteria such as below.

One upper / lower or both letters

One alpha numeric

One number

#### NEW QUESTION # 120

The user has configured AutoScaling based on the dynamic policy. Which of the following is not the right command to specify a change in capacity as a part of the policy?

- A. "adjustment=-8" (type is ExactCapacity)
- B. "adjustment=3" (type is ExactCapacity)
- C. "adjustment=-1" (type is ChangeInCapacity)
- D. "adjustment=-50" (type is PercentChangeInCapacity)

**Answer: A**

Explanation:

The user can configure the AutoScaling group to automatically scale up and then scale down based on the various specified CloudWatch monitoring conditions. The user needs to provide the adjustment value and the adjustment type. A positive adjustment value increases the current capacity and a negative adjustment value decreases the current capacity. The user can express the change to the current size as an absolute number, an increment or as a percentage of the current group size. In this option specifying the exact capacity with the adjustment value = -8 will not work as when type is exact capacity the adjustment value cannot be negative.

#### NEW QUESTION # 121

A developer must use multi-factor authentication (MFA) to access data in an Amazon S3 bucket that is in another AWS account. Which AWS Security Token Service (AWS STS) API operation should the developer use with the MFA information to meet this requirement?

- A. GetFederationToken
- B. **AssumeRole**
- C. AssumeRoleWithWebIdentity
- D. AssumeRoleWithSAML

## Answer: B

Explanation:

\* AWS STS AssumeRole: The central operation for assuming temporary security credentials, commonly used for cross-account access.

\* MFA Integration: The AssumeRole call can include MFA information to enforce multi-factor authentication.

\* Credentials for S3 Access: The returned temporary credentials would provide the necessary permissions to access the S3 bucket in the other account.

## NEW QUESTION # 122

An application deployed on AWS Elastic Beanstalk experiences increased error rates during deployments of new application versions, resulting in service degradation for users. The Development team believes that this is because of the reduction in capacity during the deployment steps. The team would like to change the deployment policy configuration of the environment to an option that maintains full capacity during deployment while using the existing instances.

Which deployment policy will meet these requirements while using the existing instances?

- A. Rolling
- B. Rolling with additional batch
- **C. Immutable**
- D. All at once

## Answer: C

Explanation:

Rolling with additional batch - Deploy the new version in batches, but first launch a new batch of instances to ensure full capacity during the deployment process.

So the old version is on new instances.

Immutable - Deploy the new version to a fresh group of instances by performing an immutable update.

New version is on new instances but the old version is on old instances so it uses existing ones.
