NEW QUESTION # 122

Which AWS Cloud deployment model uses AWS Outposts as part of the application deployment infrastructure?

- A. Hybrid
- B. On-premises
- C. Cloud-native
- D. Serverless

Answer: A

NEW QUESTION # 123

A company wants to migrate its high-performance computing (HPC) application to Amazon EC2 instances. The application has multiple components. The application must have fault tolerance and must have the ability to fail over automatically.

Which AWS infrastructure solution will meet these requirements with the LEAST latency between components?

- A. Multiple AWS Regions
- B. Multiple Availability Zones
- C. Multiple edge locations
- D. Regional edge caches

Answer: B

Explanation:

Using EC2 instances in multiple Availability Zones is an AWS infrastructure solution that meets the requirements of migrating a high performance computing (HPC) application to AWS with fault tolerance and failover capabilities, and with the least latency between components. An Availability Zone is a physically isolated location within an AWS Region that has its own power, cooling, and network connectivity. EC2 instances within the same Region can communicate with each other using low-latency private IP addresses. By using EC2 instances in multiple Availability Zones, the company can achieve fault tolerance and failover for their HPC application, because they can distribute the workload and data across different locations that are independent of each other. If one Availability Zone becomes unavailable or impaired, the company can redirect the traffic and data to another Availability Zone without affecting the performance and availability of the application.

NEW QUESTION # 124

A user needs to identify underutilized Amazon Elastic Block Store (Amazon EBS) volumes to reduce costs. Which AWS service or feature will meet this requirement?

- **A. AWS Trusted Advisor**
- B. AWS Personal Health Dashboard
- C. AWS Budgets
- D. AWS CloudTrail

Answer: A

NEW QUESTION # 125

Which AWS Cloud best practice uses the elasticity and agility of cloud computing?

- A. Break apart the application into loosely coupled components
- B. Provision capacity based on past usage and theoretical peaks
- **C. Dynamically and predictively scale to meet usage demands**
- D. Build the application and infrastructure in a data center that grants physical access

Answer: C

Explanation:

In a traditional computing environment, you provision capacity based on an estimate of a theoretical maximum peak. This can result in periods where expensive resources are sitting idle or occasions of insufficient capacity. With cloud computing, you can access as much or as little capacity as you need and dynamically scale to meet actual demand, while only paying for what you use.
