HPE7-A07試験の準備方法 | 素敵なHPE7-A07日本語問題集試験 | ユニークなAruba Certified Campus Access Mobility Expert Written Exam技術試験

HP HPE7-A07試験の困難度なので、試験の準備をやめます。実には、正確の方法と資料を探すなら、すべては問題ではありません。我々社はHP HPE7-A07試験に準備するあなたに怖さを取り除き、正確の方法と問題集を提供できます。ご購入の前後において、いつまでもあなたにヘルプを与えられます。あなたのHP HPE7-A07試験に合格するのは我々が与えるサプライズです。

HP HPE7-A07 認定試験の出題範囲:

トピック	出題範囲
トピック 1	<ul style="list-style-type: none">• Network Stack: This topic of the HP HPE7-A07 exam evaluates the ability of a senior HP RF network engineer to analyze and troubleshoot network solutions based on customer issues. Mastery of this ensures effective problem resolution in complex network environments.
トピック 2	<ul style="list-style-type: none">• Routing: This Aruba Certified Campus Access Mobility Expert Written exam section measures the ability to design and troubleshoot routing topologies and functions, ensuring that data efficiently navigates through complex networks, a key skill for HP solutions architects.
トピック 3	<ul style="list-style-type: none">• Troubleshooting: This topic of the HP HPE7-A07 exam assesses skills of a senior HP RF network engineer in troubleshooting. It also assesses the ability to remediate issues in campus networks. It is vital for ensuring network reliability and minimizing downtime in critical environments.

トピック 4	<ul style="list-style-type: none"> • Authentication • Authorization: Senior HP RF network engineers are tested on their skills in designing and troubleshooting AAA configurations, including ClearPass integration. This ensures that network access is securely managed according to the customer's requirements.
トピック 5	<ul style="list-style-type: none"> • WLAN: This HP HPE7-A07 exam topic tests the ability of a senior RF network engineer to design and troubleshoot RF attributes and wireless functions. It also includes building and troubleshooting wireless configurations, critical for optimizing WLAN performance in enterprise environments.
トピック 6	<ul style="list-style-type: none"> • Network Resiliency and Virtualization: This section of the Aruba Certified Campus Access Mobility Expert Written exam assesses the expertise of a senior HP RF network engineer in designing and troubleshooting mechanisms for resiliency, redundancy, and fault tolerance. It is crucial for maintaining uninterrupted network services.
トピック 7	<ul style="list-style-type: none"> • Switching: Senior HP RF network engineers must demonstrate proficiency in implementing and troubleshooting Layer 2 • 3 switching, including broadcast domains and interconnection technologies. This ensures seamless and efficient data flow across network segments.

HP Aruba Certified Campus Access Mobility Expert Written Exam 認定 HPE7-A07 試験問題 (Q88-Q93):

質問 # 88

Your customer's employees connected to a wired network are complaining about a poor user experience. The customer has UXI sensors deployed on their premises. These sensors have been running for multiple months.

They are testing both the wired network (using the wired Interface of each sensor) and the wireless networks.

Your customer used the UXI dashboard to find the reason for the poor user experience to find more details, the customer asked you to check the packet captures that have been downloaded from the sensors using the UXI dashboard.

From the zip file downloaded from the UXI sensors, you checked the "datagrams" .pcap file, but you were not able to find any issues. How can you explain this?

- A. The "datagrams- pcap file only contains me successful tests Failed tests are contained in the "datagrams- failed" .pcap file
- B. The datagrams captured on the physical Ethernet interface are in a different .pcap file.
- C. The UXI sensor could not upload the latest test results to the cloud, so the packet capture is outdated
- D. The default filters of the packet captures do not allow failed tests to be captured by the sensor

正解: A

解説:

It is a common practice to separate successful and failed test results into different files for ease of troubleshooting. If the "datagrams.pcap" file shows no issues, it's likely because it only contains successful test data, and the failed tests that could explain the poor user experience would be in a different file, such as "datagrams-failed.pcap."

質問 # 89

Exhibit.

A customer is reporting that connectivity is failing for some wireless client devices. What are your conclusions from the capture? (Select two.)

- A. The client does not have an ARP entry for the default gateway.
- B. The network is using WPA3-SAE key management.
- C. The client does not support beamforming.
- D. The client is not receiving an IP address.
- E. The network is using WPA2-PSK key management.

正解: D、E

解説:

The capture shows messages related to WPA key management, indicating WPA2-PSK is being used. Also, the capture includes a DHCP request from the client but no corresponding DHCP ACK, suggesting the client is not receiving an IP address, which could explain the connectivity failure.

質問 # 90

Exhibit.

What is the expected behavior for ARP traffic sent from H1?

- A. A2 will flood the ARP traffic out of all interfaces.
- B. A2 will send the ARP traffic out of ports 1/1/1-1/1/4.
- C. A2 will send the ARP traffic out of ports 1/1/1 and 1/1/3.
- D. A2 will drop the ARP traffic.

正解: A

解説:

In a VXLAN environment, unknown unicast traffic, such as ARP requests from H1, which does not have a specific destination MAC address learned by the switch A2, will be flooded out of all interfaces. This flooding behavior is necessary because A2 needs to ensure that the ARP request reaches its intended destination, which might be on any of the interfaces. It's a part of the standard behavior of switches to handle ARP traffic when the destination hardware address is unknown.

質問 # 91

What directly affects the MCS used by wireless stations? (Select two.)

- A. Retry rate
- B. Number of connected clients
- C. Frequency band
- D. SNR
- E. Channel utilization

正解: A、D

解説:

Comprehensive and Detailed Explanation (Verified Extract from HPE Aruba Networking Wireless Documentation) The Modulation and Coding Scheme (MCS) determines the data rate that a wireless station uses to transmit or receive data frames. The MCS index selection depends primarily on the signal quality and error conditions observed on the wireless link.

Two factors have a direct and measurable influence:

1. Signal-to-Noise Ratio (SNR)

A higher SNR means better signal quality and less interference, allowing the station to use higher-order modulations (e.g., 64-QAM, 256-QAM, 1024-QAM) corresponding to higher MCS indexes.

When SNR decreases, the client dynamically reduces its MCS rate to maintain reliability.

"Stations dynamically select the highest MCS index that the current SNR can support to maintain an acceptable frame error rate."

2. Retry Rate

The retry rate reflects retransmissions due to poor frame reception. A high retry rate indicates a high error rate, prompting the station to step down to a lower MCS to improve link stability.

"If retransmissions increase, the MCS rate is reduced until the error rate stabilizes." Other Options Explanation:

- * B. Channel utilization: affects airtime efficiency but not MCS selection directly.
- * C. Number of connected clients: impacts contention and throughput, not MCS per station.
- * E. Frequency band: influences propagation and SNR indirectly but does not directly control MCS selection.

Final Verified Answers: A and D

質問 # 92

A customer's infrastructure is set up to use both primary and secondary gateway clusters on the SSID profile based on best practices. What is a valid cause for having an equal split in APs connected to the primary and secondary gateway clusters?

- A. The secondary gateway cluster is homogeneous
- B. The primary gateway cluster is up, but some APs cannot reach the secondary gateway cluster. These APs would connect to the secondary gateway cluster
- **C. The primary gateway cluster is up, but some APs are unable to reach the primary gateway cluster. These APs would connect to the secondary gateway cluster**
- D. The secondary gateway cluster is heterogeneous

正解: C

解説:

In a high availability setup where both primary and secondary gateway clusters are present, APs are typically designed to connect to the primary cluster. If the APs are equally split between the primary and secondary, this may indicate that some APs cannot reach the primary cluster due to connectivity issues or reachability constraints, thus falling back to the secondary cluster.
