EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q35-Q40):

NEW QUESTION # 35

Question:

A company is looking for a backup solution that can reduce its IT management overhead and offer scalability and flexibility. Which type of backup solution would meet these requirements?

- A. Cloud-based backup
- B. Image-based backup
- C. Agent-based backup

- D. Tape-based backup

Answer: A

Explanation:

Cloud-based backupsolutions are managed by third-party providers and offer easy scalability, flexibility, and reduced IT management overhead. They allow businesses to focus on operations while the provider manages infrastructure, updates, and capacity.

* Image-based backup:Captures entire system images but may still require local storage and management.

* Agent-based backup:Deploys agents to servers, requiring management of the agents.

* Tape-based backup:Involves hardware and manual processes for storage, increasing management burden.

NEW QUESTION # 36

Question:

Refer to the Exhibit:

Identify the following FC Frame fields:

- A. 1: CRC, 2: Data field, 3: Frame header
- B. 1: CRC, 2: Frame header, 3: Data field
- **C. 1: Frame header, 2: Data field, 3: CRC**
- D. 1: Frame header, 2: CRC, 3: Data field

Answer: C

Explanation:

Full Detailed Explanation with Step by Step Solutions:

A standardFibre Channel (FC) frameconsists of several fields in a specific order. The typical sequence for an FC data frame is:
 1##Frame header:Contains control and addressing information.

2##Data field:Carries the actual payload (up to 2112 bytes).

3##CRC (Cyclic Redundancy Check):Ensures data integrity of the frame.

The diagram in the exhibit shows exactly this ordering:

- * SOF (Start of Frame)- marks the beginning of the frame.
- * 1 (Frame header)- the control and addressing info.
- * 2 (Data field)- the main data payload.
- * 3 (CRC)- for error checking.
- * EOF (End of Frame)- marks the end of the frame.

NEW QUESTION # 37

Question:

What is a read miss in cache operations?

- A. Writing data to the cache
- B. Fetching requested data that is already in cache
- C. Deleting data from the cache
- **D. Fetching data that is not in cache**

Answer: D

Explanation:

A read missoccurs when the data requested by the host isnotavailable in the cache. As a result, the storage system must fetch the

data from the slower disk storage (back-end), leading to higher latency.

* Cache hit: Data is already in cache # faster response.

* Cache miss (read miss): Data not in cache # fetched from the disk.

NEW QUESTION # 38

Question:

How does Storage Class Memory (SCM) compare to DRAM and flash memory in terms of speed?

- A. SCM is faster than both DRAM and flash
- B. **SCM is slower than DRAM but faster than flash**
- C. SCM is as fast as DRAM
- D. SCM is slower than flash but faster than HDDs

Answer: B

Explanation:

Storage Class Memory (SCM) bridges the gap between DRAM and NAND flash memory. It offers faster access times than flash memory but is still slower than DRAM. SCM provides non-volatile storage with performance characteristics closer to DRAM, making it suitable for applications requiring high-speed data access.

NEW QUESTION # 39

Question:

What is the maximum number of VLANs that can be supported with one VLAN tag field?

- A. 0
- B. **1**
- C. 2
- D. 3

Answer: B

Explanation:

In Ethernet networking, VLANs (Virtual Local Area Networks) are identified using a 12-bit VLAN ID field in the IEEE 802.1Q standard. Since 12 bits can represent $2^{12} = 4096$ unique values, the maximum number of VLANs that can be supported is 4096.

* 1024 and 2048: These values are less than the maximum and represent subsets of possible VLANs.

* 8192: This exceeds the 12-bit limit and is not supported by the standard.
