## GitHub Advanced Security GHAS Exam Sample Questions (Q65-Q70):

## NEW QUESTION # 65

In the pull request, how can developers avoid adding new dependencies with known vulnerabilities?

- A. Enable Dependabot alerts.
- B. Enable Dependabot security updates.
- C. Add Dependabot rules.
- D. **Add a workflow with the dependency review action.**

**Answer: D**

Explanation:

To detect and block vulnerable dependencies before merge, developers should use the Dependency Review GitHub Action in their pull request workflows. It scans all proposed dependency changes and flags any packages with known vulnerabilities. This is a preventative measure during development, unlike Dependabot, which reacts after the fact.

## NEW QUESTION # 66

A dependency has a known vulnerability. What does the warning message include?

- A. How many projects use these components
- B. The security impact of these changes
- C. **A brief description of the vulnerability**
- D. An easily understandable visualization of dependency change

**Answer: C**

Explanation:

When a vulnerability is detected, GitHub shows a warning that includes a brief description of the vulnerability. This typically covers the name of the CVE (if available), a short summary of the issue, severity level, and potential impact. The message also links to additional advisory data from the GitHub Advisory Database.

This helps developers understand the context and urgency of the vulnerability before applying the fix.

## NEW QUESTION # 67

What happens when you enable secret scanning on a private repository?

- A. **GitHub performs a read-only analysis on the repository.**
- B. Dependency review, secret scanning, and code scanning are enabled.
- C. Your team is subscribed to security alerts.
- D. Repository administrators can view Dependabot alerts.

**Answer: A**

Explanation:

When secret scanning is enabled on a private repository, GitHub performs a read-only analysis of the repository's contents. This includes the entire Git history and files to identify strings that match known secret patterns or custom-defined patterns. GitHub does not alter the repository, and enabling secret scanning does not automatically enable code scanning or dependency review - each must be configured separately.

## NEW QUESTION # 68

Which CodeQL query suite provides queries of lower severity than the default query suite?

- A. `github/codeql-go/ql/src@main`
- B. `github/codeql/cpp/ql/src@main`
- C. **security-extended**

**Answer: C**

Explanation:

The security-extended query suite includes additional CodeQL queries that detect lower severity issues than those in the default

security-and-quality suite.

It's often used when projects want broader visibility into code hygiene and potential weak spots beyond critical vulnerabilities. The other options listed are paths to language packs, not query suites themselves.

#### **NEW QUESTION # 69**

Which of the following options would close a Dependabot alert?

- A. Viewing the dependency graph
- B. Creating a pull request to resolve the vulnerability that will be approved and merged
- C. Viewing the Dependabot alert on the Dependabot alerts tab of your repository
- D. Leaving the repository in its current state

**Answer: B**

Explanation:

A Dependabot alert is only marked as resolved when the related vulnerability is no longer present in your code

- specifically after you merge a pull request that updates the vulnerable dependency.

Simply viewing alerts or graphs does not affect their status. Ignoring the alert by leaving the repo unchanged keeps the vulnerability active and unresolved.
