Pass VMware 2V0-15.25 Exam with PassQuestion 2V0-15.25 questions and answers in the first attempt.
<https://www.passquestion.com/>

The VMware Cloud Foundation 9.0 Support exam dumps are designed efficiently and pointedly, so that users can check their learning effects in a timely manner after completing a section. Good practice on the success rate of 2V0-15.25 quiz guide is not fully indicate that you have mastered knowledge is skilled, therefore, the 2V0-15.25 test material let the user consolidate learning content as many times as possible, although the practice seems very boring, but it can achieve the result of good consolidate knowledge.

VMware 2V0-15.25 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Plan and Design the VMware by Broadcom Solution: This domain addresses architectural planning and design principles for creating scalable, secure virtual environments aligned with business requirements.
Topic 2	<ul style="list-style-type: none">VMware by Broadcom Solution: This section focuses on understanding VMware by Broadcom's virtualization and cloud infrastructure platform for managing modern enterprise workloads.
Topic 3	<ul style="list-style-type: none">Install, Configure, Adminstrate the VMware by Broadcom Solution: This area covers installing, configuring, and managing VMware solutions including VCF Fleet deployment, expansion, and reduction operations.

Topic 4	<ul style="list-style-type: none"> • Troubleshoot and Optimize the VMware by Broadcom Solution: This domain focuses on troubleshooting VCF deployment, upgrades, conversions, workload domains, fleet operations (certificates, passwords, identity), licensing, compute resources, storage (vSAN, supplemental storage), networking (VDS, NSX), VCF Operations tools, Identity Broker automation, and HCX workload migrations.
Topic 5	<ul style="list-style-type: none"> • IT Architectures, Technologies, Standards: This domain covers fundamental frameworks, tools, and best practices for building scalable, secure, and interoperable enterprise IT systems.

2V0-15.25 Real Exam Answers, 2V0-15.25 Valid Practice Questions

All in all, our test-orientated high-quality 2V0-15.25 exam questions would be the best choice for you, we sincerely hope all of our candidates can pass 2V0-15.25 exam, and enjoy the tremendous benefits of our 2V0-15.25 prep guide. Helping candidates to pass the 2V0-15.25 Exam has always been a virtue in our company's culture, and you can connect with us through email at the process of purchasing and using, we would reply you as fast as we can.

VMware Cloud Foundation 9.0 Support Sample Questions (Q57-Q62):

NEW QUESTION # 57

An administrator has been tasked with the deletion of a workload domain within a VMware Cloud Foundation (VCF) instance. The following information has been provided:

- * There are two workload domains and a management domain within the VCF instance.
- * There is a single vSphere cluster within the workload domain to be deleted.
- * There are no user created Virtual Machines in the workload domain cluster.

When performing the deletion in VCF Operations, the task fails at the Gather input for deletion of NSX component stage. The administrator checks the details of the failed task and notices the cause of the error is stated as Cannot read the array length because "<local9>" is null.

What could be the possible cause of this error message?

- A. The NSX Edge Cluster Deployment Removal Tool was run against the workload domain.
- B. The NSX Manager is shared between the workload domains.
- C. The Network Pools associated with the workload domain were deleted using the vSphere client.
- **D. The NSX Edge cluster for the workload domain was deleted using NSX Manager.**

Answer: D

Explanation:

In VMware Cloud Foundation, deletion of a workload domain requires that VCF Operations can correctly discover and process the NSX components attached to that domain. The workload domain delete workflow explicitly includes removal of the NSX Manager and NSX Edge components associated with the domain, unless those NSX components are shared.

In earlier and current VCF guidance, VMware state that NSX Edge clusters for a workload domain must be removed using the documented/VCF-aware method (for example, using the NSX Edge removal process referenced in KB 78635, not by deleting objects directly in NSX Manager). If an administrator deletes the NSX Edge cluster directly in NSX Manager, the VCF inventory and orchestration logic still "believes" the Edge cluster exists. When the workload domain delete workflow reaches the stage "Gather input for deletion of NSX component", it queries NSX / internal state for Edge cluster data. Because the underlying object has been manually removed, the returned structure is null, which results in an internal "Cannot read the array length because "<local9>" is null" style error.

Using the NSX Edge Cluster Deployment Removal Tool as per documentation keeps VCF and NSX in sync and is the supported path, so option A is not the likely cause. Network pools and shared NSX Manager configurations do not match the specific NSX-component array/null condition described.

NEW QUESTION # 58

A VMware NSX Edge node is present in the inventory but shows "Not Ready" status In NSX Manager UI.

What should the administrator check first?

- A. The NSX Edge has been added to an Edge cluster
- B. The license key in NSX Manager UI
- **C. The NSX Edge node's uplink network configuration**
- D. The NSX Edge node's CPU reservation

Answer: C

Explanation:

The status "Node Not Ready" in the NSX Manager UI (specifically in the Configuration State column of the Edge Transport Nodes view) indicates that the NSX Manager has failed to push or validate the necessary configuration to the Edge VM.

* Check Uplink Network Configuration (Option C): This is the most common cause for a "Node Not Ready" state during deployment or operation. For an Edge Node to be "Ready" (Success/Up), it must have a valid Transport Node configuration, which includes the Uplink Profile, IP Pool (for TEPs), and mapping to the Fastpath Interfaces (N-VDS). If the uplink configuration is missing, incorrect, or the management plane cannot communicate with the edge to apply it, the node remains in a "Not Ready" state.

* Why not Option A? While an Edge must be in an Edge Cluster to be utilized by a Tier-0 Gateway, a standalone Edge Node should still report a status of "Success" (Configuration) and "Up" (Node Status) if it is healthy. Adding a "Not Ready" (unhealthy/unconfigured) node to a cluster will not fix the underlying configuration issue.

* Why not Option D? Missing CPU reservations typically lead to a "Degraded" status or service crashes (Dataplane down), but "Node Not Ready" is the specific indicator of an incomplete or stalled configuration workflow, usually tied to the transport/uplink setup.

NEW QUESTION # 59

The administrator has to change the DRS automation level in preparation to upgrade the vCenter. When making this change through VCF Operations, the following error occurs: 'Internal Error: Failed to retrieve vim client'.

What is the possible cause of this error?

- A. The vCenter is overloaded with API requests from VCF Operations.
- **B. Connectivity issue between vCenter and VCF Operations.**
- C. Insufficient licensing for the advanced vCenter features.
- D. DRS Automation is already set on the vSphere Client.

Answer: B

Explanation:

The error:

"Internal Error: Failed to retrieve vim client"

occurs when VCF Operations cannot establish a functional API session with vCenter. The vim client is the internal vSphere API client library used by VCF Operations to perform cluster actions such as modifying DRS settings, powering on/off workloads, or retrieving inventory.

When this error appears, VMware documentation identifies these common root causes:

- * Loss of connectivity between VCF Operations and vCenter
- * DNS resolution issues
- * Network interruption
- * Stale or expired authentication tokens
- * Credential mismatch If the vCenter password was changed manually, VCF Operations may be unable to authenticate.
- * vCenter services restarting or unavailable If vCenter backend services (vpxd, sts, etc.) are unstable, VCF Operations cannot establish a vim session.

Option A is incorrect-DRS automation state in the vSphere Client does not cause vim client retrieval errors.

Option B (vCenter overloaded by API requests) would cause timeouts, not a vim client initialization failure.

Option D (insufficient licensing) affects feature use, not API connectivity.

NEW QUESTION # 60

An administrator is asked to create a second provider gateway (provider gateway 02) in VMware Cloud Foundation (VCF) Automation Region-A.

After launching the Create Provider Gateway workflow in the VCF Automation Provider Management Portal, no Tier-0 Gateway is available for assignment.

How would you resolve this issue?

- A. Create a new Region.

- B. Log into the NSX Manager, create a new TO Gateway.
- C. Retry the Create Provider Gateway workflow.
- D. Log into the NSX Manager, create a new Tier-1 Gateway.

Answer: B

Explanation:

In VMware Cloud Foundation 9.0, a Provider Gateway in VCF Automation is always backed by an existing Tier-0 or Tier-0 VRF gateway in NSX. When the administrator launches the Create Provider Gateway workflow and no Tier-0 gateways appear for assignment, this indicates that VCF Automation cannot discover any valid Tier-0 gateways in the associated region.

The VMware Cloud Foundation 9.0 documentation explicitly states that before adding a Provider Gateway, an administrator must first create an Active-Standby Tier-0 Gateway in NSX Manager. The Provider Gateway workflow only lists Tier-0 gateways that already exist and are properly configured in NSX. If none are present, the list will be empty.

From the documentation: "To add a provider gateway, first you must create an Active Standby tier-0 gateway in the NSX Manager associated with the region to back it.". Provider gateways in VCF Automation are discovered from these preexisting Tier-0 gateways and cannot be created until they exist.

Creating a Tier-1 gateway (Option B) does not satisfy the requirement because Provider Gateways must map specifically to Tier-0, not Tier-1. Retrying the workflow (Option D) will not resolve the issue because the Tier-0 backing resource is missing. Creating a new region (Option A) is unnecessary unless required for other organizational reasons, and it still would not produce a Tier-0 gateway.

Therefore, the correct and verified solution is to log in to NSX Manager and create the required Tier-0 gateway, after which it will appear in the Provider Gateway creation workflow.

NEW QUESTION # 61

A user wishes to publish a VMware Cloud Foundation (VCF) Operations Orchestrator workflow to their VCF Automation project catalog, but is blocked from publishing any workflows.

The following information has been provided:

- * In the VCF Automation Organization portal, the user cannot see the Workflows option under Content Hub.
- * The organization is not a Provider Consumption Organization.

Which are the two likely causes of this issue? (Choose two.)

- A. An external VCF Operations Orchestrator is not integrated with their Organization.
- B. The user is logged in the Project Advanced User rights
- C. An embedded VCF Operations Orchestrator is not integrated with their Organization.
- D. The user is logged in with Project Administrator rights.
- E. The user is logged in with Project User rights.

Answer: A,C

Explanation:

In VMware Cloud Foundation 9.0, publishing a VCF Operations Orchestrator workflow to a VCF Automation project catalog requires that the Organization has a valid integration with VCF Operations Orchestrator. The question states that the user cannot see the Workflows option under Content Hub, and the organization is not a Provider Consumption Organization (PCO). According to the VCF 9.0 documentation, only organizations with VCF Operations Orchestrator integration are allowed to publish workflows into the catalog. Both embedded and external orchestrator integrations must be configured depending on the environment. If no orchestrator (embedded or external) is integrated with the organization, workflows cannot be listed or published. This aligns with the documented VCF Automation and VCF Operations Orchestrator design requirements, which specify that workflow publishing is only available when the orchestrator instance is properly registered.

Additionally, user role permission issues could prevent workflow visibility, but the key blockers described in the scenario are the missing workflow section and the organization type. Because the organization is not a PCO, advanced provider features—including workflow publishing—are disabled unless a proper orchestrator integration exists. Therefore, the two most likely causes are:

- * A: An external VCF Operations Orchestrator is not integrated with their Organization.
- * D: An embedded VCF Operations Orchestrator is not integrated with their Organization.

These two conditions directly match the documented behavior in VMware Cloud Foundation 9.0.

NEW QUESTION # 62

.....

We put high emphasis on the protection of our customers' personal data and fight against criminal act on our 2V0-15.25 exam

questions. Our 2V0-15.25 preparation exam is consisted of a team of professional experts and technical staff, which means that you can trust our security system with whole-heart. As for your concern about the network virus invasion, 2V0-15.25 Learning Materials guarantee that our purchasing channel is absolutely worthy of your trust.
