## first attempt & First-Grade EMT: Emergency Medical Technicians Exam

The LatestCram NREMT EMT exam dumps are being offered in three different formats. The names of these formats are EMT PDF questions file, desktop practice test software, and web-based practice test software. All these three Emergency Medical Technicians Exam exam dumps formats contain the real NREMT EMT Exam Questions that will help you to streamline the EMT exam preparation process.

### NREMT Emergency Medical Technicians Exam Sample Questions (Q53-Q58):

#### NEW QUESTION # 53

During a mass casualty incident, a patient has an open tibia and fibula deformity. Using START triage, in which of the following priorities should the EMT place the patient?

- A. Minimal
- **B. Delayed**
- C. Emergent
- D. Immediate

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

TheSTART (Simple Triage and Rapid Treatment)system classifies patients based on ability to walk, respirations, perfusion, and mental status. A patient with an open fracture who can breathe adequately, has a pulse, and follows commands is categorized as "Delayed".

Immediate (Red) is reserved for those who cannot walk and have life-threatening conditions, such as compromised airway or severe bleeding.

References:

U.S. Department of Health START Triage Protocol

FEMA MCI Guidelines

Brady Emergency Care (13th ed.) - Chapter on MCI and Incident Management

#### NEW QUESTION # 54

An unresponsive 79-year-old female has agonal respirations. You should

- A. Open her airway and suction until clear
- **B. Check for a pulse**
- C. Begin chest compressions
- D. Open her airway and ventilate her with a BVM

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Agonal respirations arenot effective breathingand can mimic gasping or snorting. They often occur in cardiac arrest. However, before initiating chest compressions, the EMT mustconfirm pulselessnessby checking acarotid pulse for no more than 10 seconds(AHA 2020 BLS Guidelines).

Only after pulse confirmation (or absence) should compressions begin. Suctioning or ventilating is premature unless a pulse is found.

AAOS EMT Textbook - Chapter: Cardiac Arrest and Resuscitation

#### NEW QUESTION # 55

Which of the following signs and symptoms indicate dehydration in an infant? Select the three correct options.

- A. Hypoglycemia

- B. Hypertension
- C. Delayed capillary refill
- D. Sunken fontanelles
- E. Flushed, dry skin
- F. Poor skin turgor

**Answer: C,D,F**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Dehydration signs in infants include:

- \* Poor skin turgor (elasticity)
- \* Sunken fontanelles (indicative of fluid loss)
- \* Delayed capillary refill (>2 seconds)

Flushed skin is more common in fever or heat illness, not dehydration. Hypotension, not hypertension, is associated with dehydration in late stages.

PALS Provider Manual - Dehydration in Infants

AAOS Emergency Care (11th ed.) - Pediatric Emergency Chapter

### NEW QUESTION # 56

Defusing sessions should do which of the following in order to be successful? Select the two correct options.

- A. Take place 72 hours or more following an incident
- B. Be held immediately following an incident
- C. Have mental health experts present during the session
- D. Allow the open sharing of information
- E. Force all providers to provide feedback

**Answer: B,D**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Defusing is an informal, short-term intervention after a critical incident. It should:

- \* Occur within hours of the event (ideally the same shift)
- \* Encourage voluntary open discussion in a confidential setting

It is not a full debrief or counseling session and doesn't require mental health professionals present. Forcing participation or waiting too long (e.g., 72+ hours) can reduce its effectiveness.

International Critical Incident Stress Foundation (ICISF) Guidelines

National EMS Education Standards - Mental Health and Stress Response

### NEW QUESTION # 57

When treating a patient suspected of having tuberculosis, you should

- A. Wear a surgical mask before treating the patient
- B. Notify the Centers for Disease Control
- C. Place a HEPA respirator on the patient
- D. Place a surgical mask on the patient

**Answer: D**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

For suspected or confirmed tuberculosis (TB), the EMT should place a surgical mask on the patient, not a HEPA respirator. Surgical masks are used to contain droplets from the patient and reduce airborne transmission.

The EMT should wear an N95 or HEPA respirator to protect against inhaling airborne particles. Notification to the CDC is not the

EMT's responsibility - that falls to public health officials.
