## ISTQB Certified Tester Usability Tester Sample Questions (Q28-Q33):

### NEW QUESTION # 28

A web shop owner used Google Analytics to gather information about her users. She found out that most users take about five minutes to place an order. Is the usability of the website good or bad?

- A. The usability of the website is good - five minutes is a fair amount of time
- **B. That depends on the context of use as users may have different expectations**
- C. That depends on the accessibility of the website
- D. The usability of the website is bad - five minutes is way too long

**Answer: B**

Explanation:

Usability is defined in ISO 9241-11 as the extent to which a system can be used by specified users to achieve specified goals with effectiveness, efficiency, and satisfaction in a specified context of use. Without knowing the context—such as product complexity, user familiarity, device type, or purchasing habits—it is impossible to judge whether five minutes is good or bad. For complex items, five minutes may be reasonable, while for one-click purchases, it may be excessive. Thus, usability cannot be assessed solely based on one metric like time—it must be evaluated within its full usage context.

**NEW QUESTION # 29**

Which of the following is the correct distinction between formative and summative usability evaluation?

- A. Summative evaluations mostly rely on experts, formative evaluations require users
- B. Summative evaluations focus on improvement, formative evaluations assess the outcome
- C. Summative evaluations mostly rely on user tests, formative evaluations require experts
- **D. Summative evaluations assess the outcome, formative evaluations focus on improvement**

**Answer: D**

Explanation:

Formative usability evaluation is conducted during the development process to identify usability problems and improve the product iteratively. It is diagnostic and improvement-focused. Summative evaluation, on the other hand, is done after development to assess the final product's usability, measuring how well it meets defined usability goals. Therefore, the correct distinction is that formative evaluation focuses on improvement, and summative evaluation assesses the outcome. This distinction aligns with widely accepted models such as those defined by ISO 9241-210 and usability.gov.

**NEW QUESTION # 30**

Which of the following is a principal task of the usability test moderator role?

- A. Create a survey plan
- B. Log usability problems
- **C. Define testing tasks**
- D. Write a usability test plan

**Answer: C**

Explanation:

The usability test moderator plays a crucial role during the execution phase of a usability test. Their principal task is to facilitate the test sessions by guiding participants through predefined testing tasks, observing behaviors, and ensuring that the test environment is neutral and free from bias. Defining testing tasks, however, is primarily done during the test design phase by the usability test designer or analyst, but the moderator ensures these tasks are clearly communicated and administered to participants during the session. Logging usability problems (option B) is often done by observers or analysts reviewing session recordings or notes, not directly by the moderator during live testing. Creating a survey plan (option C) and writing the usability test plan (option D) are preparatory activities generally done before the test sessions and are not the moderator's main focus. Therefore, the principal role of the moderator centers on conducting the sessions and managing task delivery effectively to obtain authentic user interaction with the system under test.

**NEW QUESTION # 31**

What location is NOT suitable for conducting a usability test?

- **A. A room where no action of the user can be seen or recorded by any means.**
- B. A public place, such as a cafe.
- C. Two office rooms that are connected by a video link.
- D. A room at the place where the test participant lives or works.

**Answer: A**

Explanation:

The primary goal of usability testing is to observe and record user behavior while interacting with the system.

A location where user actions cannot be seen or recorded (option A) completely undermines the test's purpose and is therefore not suitable.

While options B, C, and D are not ideal in all cases, they can still be valid settings depending on the context.

Testing in a user's natural environment (B) increases ecological validity. Remote testing via video link (C) is widely accepted. Testing in a public setting (D) can be useful for mobile apps or services intended for real-world use.

### NEW QUESTION # 32

Which of the following statements about usability testing is true?

- **A. Before the usability test sessions, a pilot usability test session can be conducted**
- B. The preparation of a usability test is optional
- C. The conditions under which a usability test is done are irrelevant
- D. A usability test consists of one usability test session

**Answer: A**

Explanation:

A pilot usability test session is a critical step prior to conducting the actual usability test. Its purpose is to ensure that the test setup, task design, and moderator instructions are clear and function as expected.

According to ISO 9241-210 and the Nielsen Norman Group's best practices, pilot testing helps detect unforeseen issues and fine-tune the process. Options A and B are incorrect because testing conditions must reflect realistic scenarios, and thorough preparation is essential to gather meaningful usability data. Option D is also incorrect; a usability test typically consists of multiple sessions with different users to gather sufficient data for analysis. The pilot session ensures everything works smoothly before involving real participants.
