The PremiumVCEDump aids students in passing the test on their first try by giving them the real questions in three formats, 24/7 support team assistance, free demo, up to 1 year of free updates, and the satisfaction guarantee. As a result of its persistent efforts in providing candidates with actual ACD201 Exam Questions, PremiumVCEDump has become one of the best platforms to prepare for the Appian ACD201 exam successfully. One must prepare with PremiumVCEDump exam questions if one wishes to pass the ACD201 exam on their first attempt.

Appian ACD201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Data Management: This section of the exam measures the skills of Solution Architects and covers designing and documenting data models, recommending record types for optimization and security, working with relational data, and implementing complex models with supporting objects.
Topic 2	<ul style="list-style-type: none"> Application Design and Development: This section of the exam measures the skills of Appian Developers and covers translating business requirements into user stories, building end-to-end applications, managing object security, applying design best practices, and ensuring user-centric experiences through proper UX design.
Topic 3	<ul style="list-style-type: none"> Performance and Scalability: This section of the exam measures the skills of Appian Developers and covers designing performant components, building memory-efficient models, conducting database load and automated testing, analyzing server memory and logs for risks, and resolving performance concerns for end users.
Topic 4	<ul style="list-style-type: none"> Advanced Appian Concepts: This section of the exam measures the skills of Solution Architects and covers creating and configuring authentication methods, setting up integration objects, designing APIs, evaluating smart services and plug-ins, and applying SSO mechanisms with SAML and LDAP.

PremiumVCEDump Appian ACD201 PDF Questions and Practice Test Software

Every detail of our ACD201 exam guide is going through professional evaluation and test. Other workers are also dedicated to their jobs. Even the proofreading works of the ACD201 study materials are complex and difficult. They still attentively accomplish their tasks. Please have a try and give us an opportunity. Our ACD201 Preparation guide will totally amaze you and bring you good luck. And it deserves you to have a try!

Appian Senior Developer Sample Questions (Q66-Q71):

NEW QUESTION # 66

Which two options are correct regarding record relationships when using synced records in your application?
(Choose two.)

- A. Record type relationships enforce referential integrity.
- B. Relationships can be established between any record types that have sync enabled, regardless of the source.
- C. Many-to-one relationships can be established using record relationships.
- D. Up to 20 relationships can be added on a record type with data sync enabled.

Answer: C,D

Explanation:

Many-to-one relationships can be established between record types using record relationships.

Up to 20 relationships can be added to a record type with data sync enabled, according to Appian platform limits.

NEW QUESTION # 67

The synced record Task has a self-referential relationship defined in the column parentTaskId. There is a many-to-one record relationship between the id and parentTaskId called parentTask.

For a given task ID, you need to return the task name and the parent task name.

What should you do?

- A. Create a sync-time custom record field on the Task record called parentName. Specify this field to return in the query field selection.
- B. Use `a!queryRecordType()` with a filter on the task id, with fields specified to return `recordType!Task.name` and `recordType!Task.parentTask.name`.
- C. Use `a!queryRecordType()` filtered on the task id once to return the task name and parent task ID. Query the record again to return the parent task name.

Answer: B

Explanation:

Using `a!queryRecordType()` with a filter on the task ID and specifying both `recordType!Task.name` and `recordType!Task.parentTask.name` in the fields will efficiently return both the task name and its parent task name in a single query.

NEW QUESTION # 68

There are two record types, ABC and XYZ, with sync enabled. The XYZ record type is added as a relationship into the ABC record type.

A user has Viewer permission to the ABC record type but does not have access to the XYZ record type.

A site page is presented to the user where the data is sourced from the ABC record type and its related record type the XYZ reference.

What information does the user see on the site page?

- A. Page is presented to the user with the XYZ record type data and fields references redacted.
- B. Page does not load and an error message is presented: "The record type [identifier=XYZ] does not exist, has been deleted, or you do not have sufficient privileges to access its data."
- C. Page is presented to the user and the data references to the XYZ record type appear as "null".

Answer: B

Explanation:

Because the interface references fields on the XYZ record type, the user must have at least Viewer permission on XYZ as well as on ABC. Since the user lacks access to XYZ, the query cannot be executed and the page fails to load, displaying the error:

"The record type [identifier = XYZ] does not exist, has been deleted, or you do not have sufficient privileges to access its data."

NEW QUESTION # 69

You're creating a point-of-sale (POS) system for a customer which can associate the items in a transaction to a customer based on a membership number. The item stock table and the customer sales record are hosted elsewhere and need to be written to via POST APIs from an Appian process model. This all occurs within a transaction process model that you're creating.

Which two steps should you perform to design your process model to improve process memory? (Choose two.)

- A. Ensure that the entire process is activity-chained so that the person entering the transaction knows when the process is completed.
- **B. Create the two POST APIs as asynchronous subprocesses.**
- C. Create the two POST APIs as synchronous subprocesses.
- **D. Add a terminate process node to the end of the process.**

Answer: B,D

Explanation:

Creating the POST API calls as asynchronous subprocesses allows them to run independently, reducing memory usage in the main process.

Adding a terminate process node at the end ensures the process completes and releases memory as soon as its work is finished.

NEW QUESTION # 70

An insurance company's product details are currently distributed across numerous database tables, encompassing over 60 to 70 fields.

You need to implement a product comparison tool for business users to compare up to three insurance products simultaneously, with all the product details in a tabular format.

Refer to the following sample format:

□ Which object should be used to transform the data into the required format?

- A. Stored procedure
- B. Record type with relationships
- **C. VCCViews**

Answer: C

Explanation:

Database views are ideal for transforming complex, distributed product data into a single, flattened structure tailored for reporting or comparison. In this case, a view can pivot the 60-70 fields and organize them by attribute (e.g., Name, Type, Premium) across multiple product columns, enabling a tabular comparison layout like the one shown. Views also optimize performance and reduce transformation overhead in the interface layer.

NEW QUESTION # 71

.....

PremiumVCEDump provides updated and valid Appian Exam Questions because we are aware of the absolute importance of updates, keeping in mind the dynamic Appian Senior Developer exam syllabus. We provide you update checks for 1 year after purchase for absolutely no cost. We also give a 30% discount on all Appian ACD201 Dumps.
