In this Desktop-based Cisco 300-420 practice exam software, you will enjoy the opportunity to self-exam your preparation. The chance to customize the Cisco 300-420 practice exams according to the time and types of Designing Cisco Enterprise Networks (300-420) practice test questions will contribute to your ease. This format operates only on Windows-based devices. But what is helpful is that it functions without an active internet connection. It copies the exact pattern and style of the real Designing Cisco Enterprise Networks (300-420) exam to make your preparation productive and relevant.

Cisco 300-420 exam consists of 60-70 questions and has a duration of 90 minutes. 300-420 exam is computer-based and can be taken at any Pearson VUE testing center. 300-420 exam fee is \$300 USD, and candidates must achieve a passing score of at least 750 out of 1000 to obtain the certification. 300-420 exam topics include advanced addressing and routing solutions, advanced enterprise campus networks, WAN technologies, enterprise network design, and security services.

To prepare for the Cisco 300-420 exam, candidates can take advantage of various training resources provided by Cisco, such as instructor-led courses, online training modules, and self-study materials. They can also gain hands-on experience by working with Cisco technologies in real-world scenarios. Exam candidates are recommended to have at least three to five years of experience working with enterprise networks before taking the exam.

Cisco 300-420 Exam covers a wide range of topics, including advanced routing protocols, network security, virtualization, automation, and network design principles. Candidates will be required to demonstrate their understanding of these topics by

answering a variety of multiple-choice questions and scenario-based questions. 300-420 exam is designed to test candidates' knowledge and skills related to designing enterprise-level networks that meet the business requirements of organizations. Candidates who pass the exam will earn the Cisco Certified Design Professional (CCDP) certification, which is highly valued in the IT industry and recognized globally.

Cisco Designing Cisco Enterprise Networks Sample Questions (Q69-Q74):

NEW QUESTION # 69

Refer to the exhibit.

Refer to the exhibit. An architect must design a solution to connect the two ASes. To optimize bandwidth, the design will implement load sharing between router R6 and router R4. Which solution should the design include?

- A. Configure the eBGP TTL to support eBGP multihop.
- **B. Use maximum-paths to install multiple paths in the routing table.**
- C. Use next-hop-self attributes only for routes that are learned from eBGP peers.
- D. Use update-source to specify the Loopback interface.

Answer: B

NEW QUESTION # 70

Which function does the Cisco SD-Access intermediate node perform?

- A. Map users to a virtual network.
- **B. Route and transport IP traffic.**
- C. Act as an anycast Layer 3 gateway.
- D. Act as LISP proxy tunnel router.

Answer: B

Explanation:

An SD-Access intermediate node routes and transports IP traffic between fabric nodes. It is part of the underlay transport path, comparable to a routed distribution or core device that provides IP reachability between edge, border, and control-plane nodes. Intermediate nodes do not perform endpoint registration, VXLAN encapsulation for attached users, virtual-network mapping, or anycast gateway services. Those functions belong primarily to fabric edge nodes. They also do not act as LISP proxy tunnel routers, which is a border-node function used for communication between the fabric and external networks. The intermediate node's role is deliberately simple: maintain underlay routing, provide resilient transport, and forward encapsulated traffic across the fabric infrastructure. This separation of roles is what lets Cisco SD-Access scale by keeping endpoint intelligence at the edge and mapping intelligence in the control plane while the intermediate layer remains a stable IP transport network. Reference topics: SD-Access intermediate node, routed underlay, IP transport, fabric roles, edge and border node separation.

NEW QUESTION # 71

Which two border nodes are available in the Cisco SD-Access architecture? (Choose two.)

- A. internal border
- B. edge border
- C. extended border
- D. intermediate border
- E. anywhere border

Answer: A,E

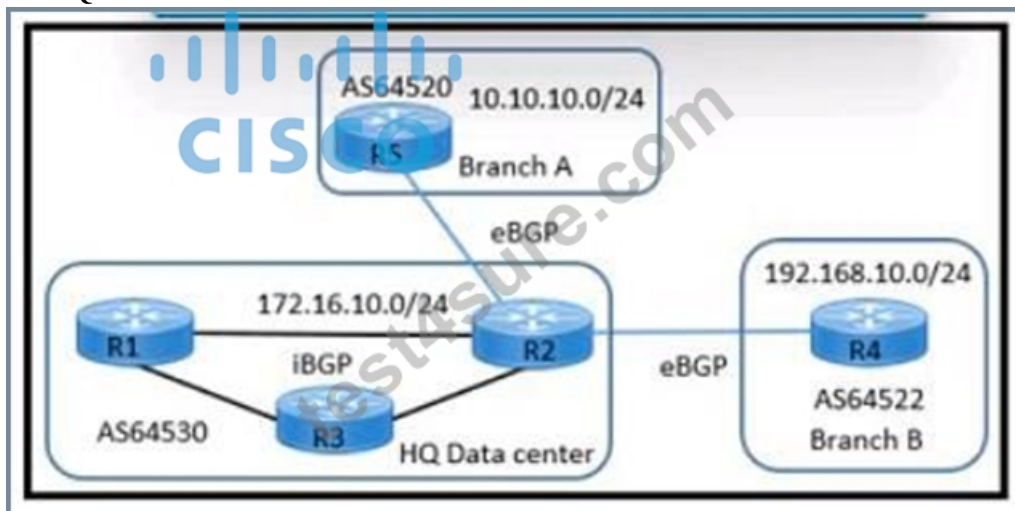

Explanation:

There are 3 types of border nodes in SD-Access:

External. Default exit from fabric with no specific routes injection

Internal. Gateway only for a set of networks, such as shared services prefixes Anywhere. Combination of external and internal functionality

NEW QUESTION # 72

Refer to the exhibit. A network engineer with an employee ID: 4384:99:754 must design a BGP solution based on these conditions:

- * Traffic sessions occur between the branches and the data center.
- * Branch B has limited resources to process routing updates.
- * HQ must filter out all prefixes from branch A to R4.

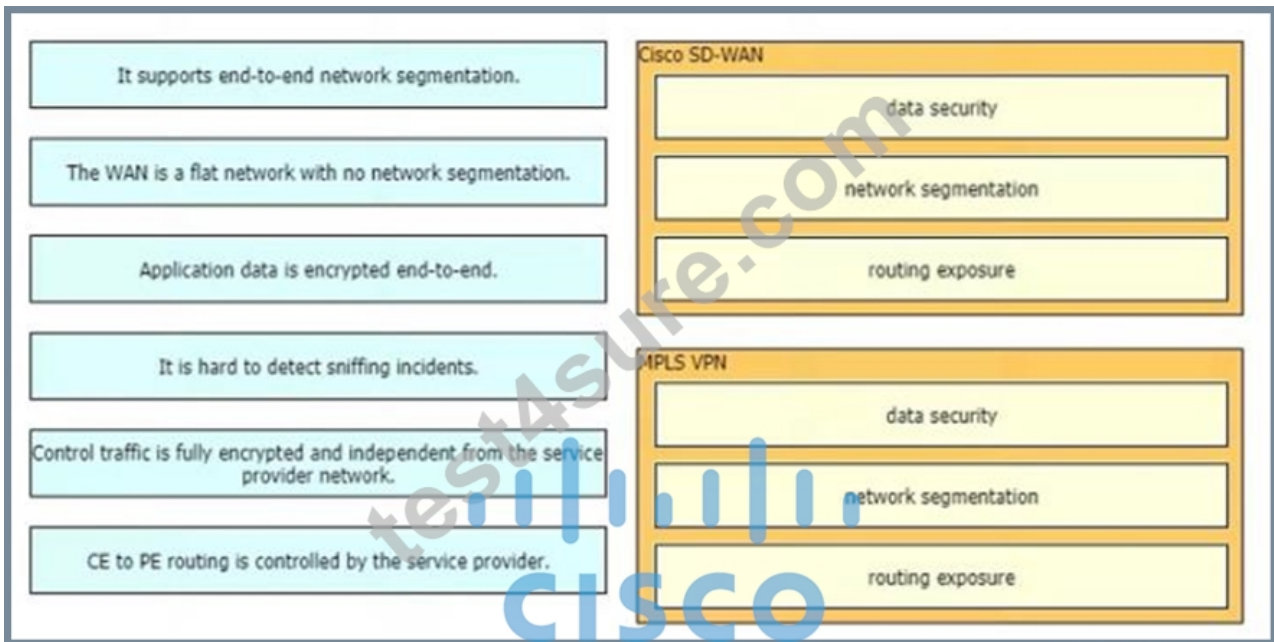

Which outbound route filtering (ORF) solution must the engineer choose?

- A. Use a prefix list with the 192.168.10.0/24 subnet for ORF on R4.
- B. Use a prefix list with the 192.168.10.0/24 subnet for ORF on R2.
- C. Use a prefix list with the 10.10.10.0/24 subnet for ORF on R5.
- D. Use a prefix list with the 10.10.10.0/24 subnet for ORF on R2

Answer: D

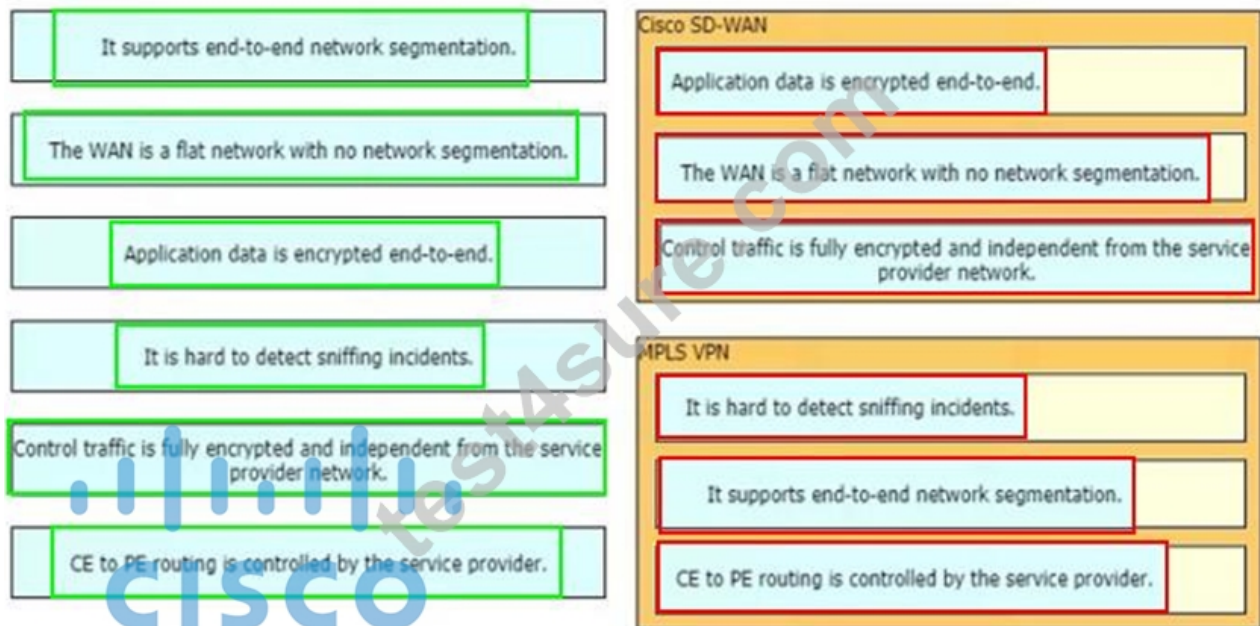

NEW QUESTION # 73

Drag and drop the description from the left onto the corresponding WAN connectivity types and categories on the right.

Answer:

Explanation:
