## Linux Foundation Certified GitOps Associate Sample Questions (Q15-Q20):

### NEW QUESTION # 15

In the context of GitOps, what is the purpose of a State Store?

- A. To provide a system for storing the current state of an application.
- **B. To provide a system for storing immutable versions of Desired State declarations.**
- C. To provide a system for storing temporary state data during GitOps deployments.
- D. To provide a system for storing mutable versions of Desired State declarations.

**Answer: B**

Explanation:

A State Store in GitOps is the system of record where Desired State declarations are kept. It must be immutable and versioned to ensure full auditability, traceability, and rollback capabilities. Git itself is the most common State Store.

"The Desired State must be stored in a State Store that is versioned and immutable. This guarantees traceability and enables recovery by reverting to previous commits." Thus, the correct answer is D.

References: GitOps Terminology (CNCF GitOps Working Group).

### NEW QUESTION # 16

Which of these Git commands will enact a rollback of the configuration to a previous commit?

- A. git branch
- B. git push
- **C. git revert**
- D. git commit

**Answer: C**

Explanation:

In GitOps, rollback is performed by reverting the system's Desired State stored in Git. This is done with the `git revert` command, which creates a new commit that undoes the changes introduced by a previous commit.

"Because Git provides an immutable history of changes, rollbacks are straightforward. Reverting to a previous configuration is accomplished by reverting the commit in Git, which then allows the reconciler to apply the earlier desired state." Thus, the correct answer is B: `git revert`.

References:GitOps Tooling (CNCF GitOps Working Group).

### NEW QUESTION # 17

Which deployment and release pattern involves gradually shifting traffic from an old version of an application to a new one?

- A. Red/Black Deployment
- B. Blue-Green Deployment
- **C. Canary Deployment**
- D. A/B Deployment

**Answer: C**

Explanation:

A Canary Deployment gradually introduces a new application version to a small subset of users before expanding to the full user base. This pattern allows testing and validation in production while reducing risk.

"Canary deployments progressively roll out changes to a small group of users, monitoring for issues before routing all traffic to the new version. This gradual shift minimizes risk and ensures safer releases." Thus, the correct answer is B.

References:GitOps Patterns (CNCF GitOps Working Group), Progressive Delivery.

### NEW QUESTION # 18

Which of the following best describes the role of Git as the "single source of truth" in GitOps?

- A. Git is primarily used for versioning, but runtime configurations are excluded from GitOps workflows.
- B. Git stores only application source code, while deployment configurations are managed elsewhere.
- **C. Git acts as the sole system of record for both infrastructure and application declarative configurations.**
- D. Git is optional in GitOps; any version control system or manual configuration management can serve the same purpose.

**Answer: C**

Explanation:

The core foundation of GitOps is that Git serves as the single source of truth for the desired state of both applications and infrastructure. This means all configuration is declared in Git in a version-controlled, auditable, and verifiable manner. Operators and reconciliation agents continuously pull these definitions to ensure the live system matches what Git declares.

"Declarative descriptions of the desired state of the system must be versioned in Git, making Git the single source of truth. This provides auditability, reliability, and enables rollbacks by reverting changes in Git." This principle ensures that any change in system state is traceable through Git commits, making environments predictable, reproducible, and transparent.

References: GitOps Principles (CNCF GitOps Working Group), Principle 1: The desired system state is declarative and versioned in Git repositories.

### NEW QUESTION # 19

In the context of GitOps, what does Continuous mean?

- A. Reconciliation happens only during instantiation.
- **B. Reconciliation continues to happen.**
- C. Reconciliation must happen instantaneously.
- D. Reconciliation only happens once.

**Answer: B**

Explanation:

One of the four core GitOps principles is that the system must be Continuously Reconciled. This means reconciliation is not a one-time or on-demand process but happens constantly in the background, ensuring the actual system state remains aligned with the declared desired state.

"GitOps requires that reconciliation is continuous. Software agents continuously compare actual state against desired state and automatically reconcile differences." Thus, the correct answer is C.

References:GitOps Principles (CNCF GitOps Working Group), Principle 4: Continuously reconciled.
