WGU Cloud Deployment and Operations Sample Questions (Q36-Q41):

NEW QUESTION # 36

(Which two languages are used by CloudFormation to define infrastructure? Choose 2 answers.)

- A. C#
- B. YAML
- C. JSON
- D. XML

Answer: B,C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

AWS CloudFormation uses YAML and JSON languages to define infrastructure as code (IaC) templates, specifying resources, parameters, and configurations. These formats are human-readable and support the creation of stacks for provisioning AWS resources. The WGU Cloud Deployment and Operations Study Guide (Section 5.3, CloudFormation) states, "CloudFormation templates can be written in YAML or JSON, both of which are supported for defining infrastructure resources like EC2 instances and S3 buckets." XML and C# are not supported languages for CloudFormation templates.

NEW QUESTION # 37

(Which service enables a company to enforce and manage governance rules across multiple AWS accounts?)

- A. Systems Manager
- B. Security Hub
- C. Control Tower
- D. GuardDuty

Answer: C

Explanation:

AWS Control Tower enables a company to enforce and manage governance rules across multiple AWS accounts by setting up a landing zone with preconfigured policies for security, compliance, and operations. It simplifies multi-account management. The WGU Cloud Deployment and Operations Study Guide (Section 6.5, Control Tower) states, "Control Tower provides a centralized solution to establish and enforce governance rules across multiple accounts, using guardrails and a landing zone to ensure compliance with organizational policies." Security Hub, GuardDuty, and Systems Manager do not offer this multi-account governance capability.

NEW QUESTION # 38

(Which solution should be used to host content to be processed for Amazon Made?)

- A. DynamoDB
- B. S3
- C. DocumentDB
- D. EC2

Answer: B

Explanation:

Amazon S3 (Simple Storage Service) should be used to host content to be processed for Amazon Made, as it provides scalable object storage ideal for storing and retrieving large amounts of data, such as media files or documents, for processing workflows. The WGU Cloud Deployment and Operations Study Guide (Section 2.1, Amazon S3) states, "S3 is the preferred solution for hosting content to be processed by services like Amazon Made, offering durable and highly available storage with support for lifecycle policies and integration with other AWS services." DocumentDB, DynamoDB, and EC2 are not designed for this content hosting purpose.

NEW QUESTION # 39

(Which Performance Insights view provides information on the hardware resource that may be causing a bottleneck?)

- A. Hosts

- B. Statement
- C. Users
- D. Wait event

Answer: D

Explanation:

The Wait event view in Amazon RDS Performance Insights provides information on hardware resources (e.g., CPU, I/O, memory) that may be causing bottlenecks by showing wait times for database operations. The WGU Cloud Deployment and Operations Study Guide (Section 7.2, Performance Insights) states, "The Wait event view in Performance Insights identifies resource bottlenecks (e.g., I/O wait times) by analyzing wait states, helping optimize database performance on hardware resources." Users, Hosts, and Statement views focus on different aspects and do not directly address hardware bottlenecks.

NEW QUESTION # 40

(What is the role of a patch baseline in Patch Manager?)

- A. Assigns an IAM role for services that can auto-approve patches upon release
- B. Notifies Config of any patch updates that need to be performed
- C. Installs all patch updates as they become available by default
- D. Defines patches that should and should not be installed on EC2 instances

Answer: D

Explanation:

A patch baseline in Patch Manager defines the patches that should and should not be installed on EC2 instances, specifying approval rules for security updates, other updates, and exclusions. This ensures controlled and compliant patching. The WGU Cloud Deployment and Operations Study Guide (Section 5.2, Patch Manager) states, "A patch baseline specifies which patches are approved for installation and which are excluded, allowing customization of patch deployment (e.g., approving only critical security updates)." Options A, B, and D misrepresent the baseline's role, as it does not auto-install, assign IAM roles, or notify Config directly.
