Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q68-Q73):

NEW QUESTION # 68

Universal Containers (UC) is considering updating their Salesforce Release Management process. Which three best practices should UC consider for Version Control? Choose 3 answers

- A. Maintain unrestricted access to the release sandboxes for all changes being deployed.
- B. Maintain separate developer branches for minor and major releases.
- C. Maintain a single repository for application with individual branches for projects.
- D. Automation is a must with various application branches in the repository.
- E. Maintain a single entry point for production from the master branch.

Answer: B,C,E

NEW QUESTION # 69

Which two statements are accurate about why Mock objects are needed when writing test classes?
Choose 2 answers

- A. A Mock is needed whenever the code makes an HTTP callout.
- B. Mock can also be used on the classes that extend the batchable interface to bypass the batch jobs.
- C. Some methods are invoking long running processes, using Mock is a shortcut of bypassing the long executions.
- D. Using a Mock allows the test class to bypass the dependencies of other objects, methods, state, or behaviors. Therefore, the developer has total control of his own code.

Answer: A,D

Explanation:

Explanation

Mock objects are needed when writing test classes to simulate the behavior of real objects or external services that are not available or accessible in the test context. Using a Mock allows the test class to bypass the dependencies of other objects, methods, state, or behaviors, and therefore, the developer has total control of their own code. This is especially useful when the code makes an HTTP callout, as the test class cannot actually call an external web service. A Mock is needed to provide a fake response for the HTTP callout. A Mock is not needed for the classes that extend the batchable interface, as the test class can use the Test.startTest and Test.stopTest methods to execute the batch jobs synchronously. A Mock is not a shortcut for bypassing long running processes, as the test class should still test the functionality and performance of the code.

NEW QUESTION # 70

Universal Containers' developers are working on a Visualforce page in a sandbox when an administrator adds a new field to Production. Which two approaches could an architect suggest to an administrator that would assist the developers in their development process? Choose 2 answers

- A. Manually replicate the same changes in the developer sandbox to ensure that changes made in production are reflected in the sandbox that the developers are working on
- B. Use a Change Set to deploy the changes from Production to the sandbox, to ensure that changes made in production are reflected in the sandbox that the developers are working on
- C. Refresh the developer sandbox to ensure that changes made in production are reflected in the sandbox that the developers are working on
- D. Use Salesforce-to-Salesforce to deploy the changes from Production to the sandbox, to ensure that changes made in production are reflected in the sandbox that the developers are working on

Answer: A,B

Explanation:

Using a Change Set or manually replicating the changes in the developer sandbox are both valid approaches to ensure that changes made in production are reflected in the sandbox that the developers are working on.

Refreshing the developer sandbox would overwrite any changes made by the developers, and Salesforce-to-Salesforce is not a deployment tool.

NEW QUESTION # 71

A developer on the Universal Containers team has written a test class to test a method that involves a web service callout. Within the test class, the developer is supposed to load test data, create an instance of the Mock object, set the Test.setMock() to that Mock object, call startTest(), execute the code that makes the callout, call stopTest(), and compare the result with expectations.

Unfortunately, the Developer forgot to use the Test.setMock() method step.

What would happen when the developer runs this test class?

- A. The test class fails without error message since the test class will simply skip the webservice callout during the execution.
- B. The test class would make the web service callout and may or may not fail depending on the circumstances on the web service end
- C. It is impossible to miss the Test.setMock() statement, the Developer Console will not let the developer save it since the test method callout
- D. The test class fails and the developer will see a message stating: Methods defined as TestMethod do not support Web service callouts.

Answer: D

Explanation:

The test class will fail and the developer will see a message stating: Methods defined as TestMethod do not support Web service callouts. This is because the test class cannot make a real web service callout, as it would depend on an external service that may not be available or reliable. Therefore, the developer needs to use the Test.setMock() method to specify a mock class that simulates the web service response. The test class will not skip the web service callout, nor will it make the actual callout. It is possible to save the test class without the Test.setMock() statement, but it will not run successfully.

NEW QUESTION # 72

Universal Containers (UC) had been using change sets for deploying all of the modifications to its Sales Cloud apps. After multiple business units joined the single Salesforce instance, there is a need to evaluate which development model is the most suitable for UC. The IT management has shown a particular interest in finding out more about the package development model.

As an architect, which two statements can be made to articulate the differences between the change set model and package development model?

Choose 2 answers

- A. In package development, the source of truth is the metadata in the package project, which makes it easy to integrate to a version control system.
- B. In package development, the best practice is to consider the dependencies and build the dependencies into the package so it can be deployed in any other target orgs.
- C. A change set can be retrieved from the developer's workbench as a package, then pushed into the version control system to achieve the versioning control.
- D. In change set development, the source of truth is a combination of the metadata already in the environment and the content of your change set.

Answer: A,D
