<https://drive.google.com/open?id=1LrUBnczj7jAigRDyyy440taQoaXLakna>

By contrasting with other products in the industry, our Analytics-Admn-201 test guide really has a higher pass rate, which has been verified by many users. As long as you use our Analytics-Admn-201 exam training I believe you can pass the exam. If you fail to pass the exam, we will give a full refund. Analytics-Admn-201 learning guide hopes to progress together with you and work together for their own future. The high passing rate of Salesforce Certified Tableau Server Administrator exam training guide also requires your efforts. If you choose Analytics-Admn-201 test guide, I believe we can together contribute to this high pass rate.

In this competitive society, being good at something is able to take up a large advantage, especially in the IT industry. Gaining some IT authentication certificate is very useful. Salesforce Analytics-Admn-201 is a certification exam to test the IT professional knowledge level and has a Pivotal position in the IT industry. While Salesforce Analytics-Admn-201 exam is very difficult to pass, so in order to pass the Salesforce certification Analytics-Admn-201 exam a lot of people spend a lot of time and effort to learn the related knowledge, but in the end most of them do not succeed. Therefore PrepAwayTest is to analyze the reasons for their failure. The conclusion is that they do not take a pertinent training course. Now PrepAwayTest experts have developed a pertinent training program for Salesforce Certification Analytics-Admn-201 Exam, which can help you spend a small amount of time and money and 100% pass the exam at the same time.

New Analytics-Admn-201 Dumps Book 100% Pass | High Pass-Rate Salesforce Certified Tableau Server Administrator Dumps Free Pass for sure

Every mock exam session will have time limit to train you excel in managing time during your actual Prepare for your Salesforce Certified Tableau Server Administrator (Analytics-Admn-201) Exam Questions. All practice questions will be just like the original Analytics-Admn-201 Exam i.e., tricky and difficult. Those who have Windows-based computers can easily attempt the Salesforce Certified Tableau Server Administrator (Analytics-Admn-201) practice exam.

Salesforce Analytics-Admn-201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Connecting to and Preparing Data: This section of the exam measures the skills of Tableau Administrators and covers the basic understanding of Tableau Server's interface, navigation, and overall topology. Candidates are expected to recognize both client and server components, understand how these interact, and know where to find information about versions, releases, and updates. It also focuses on system requirements, including hardware, operating systems, browsers, email configurations, cloud considerations, and licensing models. Additionally, it examines knowledge of server processes, data source types, network infrastructure, and ports needed for a stable deployment.
Topic 2	<ul style="list-style-type: none"> Administration: This section of the exam measures the skills of Tableau Administrators and covers the day-to-day tasks of maintaining Tableau Server. Candidates should understand how to create and manage schedules, subscriptions, backups, and restores, as well as how to use tools such as TSM, Tabcmd, and REST API. It emphasizes monitoring, server analysis, log file usage, and embedding practices. It also includes managing projects, sites, and nested structures, while contrasting end-user and administrator abilities. Knowledge of publishing, web authoring, sharing views, caching, and data source certification is also tested.
Topic 3	<ul style="list-style-type: none"> Installation and Configuration: This section of the exam measures the skills of Server Engineers and covers the process of installing Tableau Server, understanding installation paths, identity store options, SSO integrations, SSL setup, and silent installs. Candidates also need to demonstrate the ability to configure Tableau Server by setting cache, distributing processes, customizing sites, and configuring user quotas. It further includes adding users, managing their roles and permissions, and applying Tableau's security model at different levels from sites to workbooks.
Topic 4	<ul style="list-style-type: none"> Troubleshooting: This section of the exam measures the skills of Support Specialists and covers resolving common Tableau Server issues. Candidates must know how to reset accounts, package logs, validate site resources, rebuild search indexes, and use analysis reports. It also includes understanding the role of browser cookies and creating support requests when needed.
Topic 5	<ul style="list-style-type: none"> Migration & Upgrade: This section of the exam measures the skills of System Engineers and covers the process of upgrading and migrating Tableau Server environments. Candidates should understand how to carry out clean reinstalls, migrate servers to new hardware, and maintain backward compatibility during the process.

Salesforce Certified Tableau Server Administrator Sample Questions (Q56-Q61):

NEW QUESTION # 56

What two events must occur for Tableau Server to recompute queries for a workbook cache after a scheduled refresh? (Choose two.)

- A. The workbook has been viewed recently
- B. The workbook has upcoming scheduled refresh tasks
- C. The All Users group has a permission rule allowing access to the workbook
- D. The workbook was published in the last month

Answer: A,B

Explanation:

Tableau Server uses caching to speed up workbook loading by storing query results. After a scheduled extract refresh updates the data, the cache may need recomputing-let's dive into the mechanics:

* Caching Basics:

* VizQL Cache: Stores rendered views and query results for faster access.

* Refresh Trigger: A scheduled refresh updates the underlying extract (.hyper), but the cache isn't automatically invalidated-it's demand-driven.

- * Recompute Conditions: Tableau recomputes the cache when the workbook is accessed (viewed) and its data has changed (e.g., via refresh).
- * Evaluation:
- * Option B (The workbook has upcoming scheduled refresh tasks): Correct.
- * Why: An upcoming refresh task indicates the workbook relies on an extract with a schedule. After the refresh runs, the data changes, priming the cache for recomputation on next view. Without a schedule, no refresh occurs, so this is a prerequisite.
- * Detail: Schedules are set in Schedules > Tasks-e.g., "Daily at 2 AM."
- * Option D (The workbook has been viewed recently): Correct.
- * Why: Viewing triggers cache recomputation if the data has changed (e.g., post-refresh).

Tableau uses a "lazy caching" model-cache updates only when a user loads the workbook, ensuring fresh results.

- * Detail: "Recently" isn't strictly defined but implies post-refresh access.
- * Option A (Published in the last month): Incorrect.
- * Why: Publish date is irrelevant-cache recomputation ties to data changes and access, not publication timing.
- * Option C (All Users group has permission rule allowing access): Incorrect.
- * Why: Permissions enable viewing, but recomputation requires actual access (viewing) and a refresh event, not just potential access.

Why This Matters: Caching balances performance and freshness-understanding triggers prevents stale data surprises.
 Reference: Tableau Server Documentation - "Caching and Performance" (https://help.tableau.com/current/server/en-us/perf_cache.htm).

NEW QUESTION # 57

What event is most likely to cause problems for a Tableau Server?

- A. Using a non-default installation path
- B. Separating the Backgrounder and VizQL processes to different machines
- **C. Running additional software on the server**
- D. Configuring the server to use a static IP address

Answer: C

Explanation:

Tableau Server's performance and stability depend on dedicated resources and proper configuration. Running additional software on the same server is the most likely to cause problems because:

- * Resource contention: Tableau Server requires significant CPU, RAM, and disk I/O. Other software (e.g., databases, web servers) can compete for these resources, leading to slowdowns, crashes, or failed tasks.
- * Port conflicts: Tableau uses specific ports (e.g., 80, 443, 8850), and other applications might interfere.
- * Security risks: Additional software increases the attack surface, potentially compromising Tableau Server.

Tableau recommends running the server on dedicated hardware without unrelated applications.

* Option A (Running additional software on the server): Correct. This is a common cause of performance issues and is explicitly discouraged in Tableau's best practices.

* Option B (Separating the Backgrounder and VizQL processes to different machines): Incorrect.

This is a supported multi-node configuration that can improve performance, not cause problems, if properly set up via TSM.

* Option C (Configuring the server to use a static IP address): Incorrect. A static IP is recommended for Tableau Server to ensure consistent network access, so it's unlikely to cause issues.

* Option D (Using a non-default installation path): Incorrect. While not default, a custom path is supported (via TSM or installer options) and unlikely to cause problems if permissions and disk space are adequate.

Reference: Tableau Server Documentation - "Best Practices for Installation" (https://help.tableau.com/current/server/en-us/install_best_practices.htm).

NEW QUESTION # 58

You have an existing group subscription. You add a user to the group. What statement correctly describes the result?

- A. The creator of the subscription receives notice of the change and must manually edit the subscription to reflect the new group membership
- B. The administrator receives a notice to approve or deny adding the user to the subscription
- C. The subscription will continue to include only the members of the group at the time the subscription was made
- **D. The subscription updates automatically to include the new user**

Answer: D

Explanation:

Subscriptions in Tableau Server deliver workbook views to users via email on a schedule. Group subscriptions apply to all group members-let's unpack this:

* Group Subscription Mechanics:

* Created via Workbooks > Actions > Subscribe > Select Group.

* Delivers content to all users in the group at the time the subscription runs (e.g., daily PDF).

* Dynamic: Membership updates (additions/removals) are reflected automatically on the next run.

* Option C (The subscription updates automatically to include the new user): Correct.

* Details: When you add a user to the group (e.g., via Users > Groups > Add Users), Tableau Server's subscription process queries the group's current membership at runtime. The new user receives the subscription on the next scheduled delivery-no manual action needed.

* Example: Group "Sales" has a 9 AM subscription. Add a user at 8 AM-they get the email tomorrow at 9 AM.

* Option A (Admin receives notice to approve/deny): Incorrect.

* Why: No approval workflow exists for group membership changes in subscriptions-it's automatic.

* Option B (Creator must manually edit): Incorrect.

* Why: Subscriptions are tied to the group, not a static user list-manual edits aren't required for membership changes.

* Option D (Only members at creation time): Incorrect.

* Why: This would be true for individual subscriptions (static list), but group subscriptions are dynamic.

Why This Matters: Dynamic group subscriptions streamline content delivery as teams evolve, reducing admin overhead.

Reference: Tableau Server Documentation - "Manage Subscriptions" (<https://help.tableau.com/current/server/en-us/subscribe.htm>).

NEW QUESTION # 59

What is the minimum required free hard disk space recommended for a Tableau Server installation in production?

- A. 15 GB
- B. 32 GB
- C. 50 GB
- D. 64 GB

Answer: C

Explanation:

Tableau Server has specific hardware requirements for production environments to ensure stability and performance. The minimum recommended free disk space for a production installation is 50 GB. This accounts for:

* The installation itself (approximately 1-2 GB).

* Space for log files, temporary files, and extracts managed by the File Store and Data Engine.

* Room for backups and operational overhead.

The full minimum hardware recommendations for a single-node production deployment are:

* 8 CPU cores (2.0 GHz or faster).

* 32 GB RAM.

* 50 GB free disk space (on the system drive, typically C: on Windows).

* Option A (32 GB): Incorrect. While 32 GB is the minimum RAM requirement, it's insufficient for disk space in production.

* Option B (50 GB): Correct. This matches Tableau's official recommendation for production environments.

* Option C (15 GB): Incorrect. 15 GB is the minimum for a non-production or trial installation, not production.

* Option D (64 GB): Incorrect. While 64 GB exceeds the minimum, it's not the specified requirement-50 GB is sufficient.

Reference: Tableau Server Documentation - "Minimum Hardware Recommendations" (<https://help.tableau.com/current/server/en-us/requirements.htm>).

NEW QUESTION # 60

What are two intervals when Tableau Server verifies if data conditions for data-driven alerts are true? (Choose two.)

- A. Whenever a new extract is published
- B. Every 60 minutes
- C. Every 10 minutes
- D. Whenever extracts in the related workbook are refreshed

Answer: B,D

Explanation:

Data-driven alerts notify users when data meets conditions (e.g., sales > \$10K). Let's examine when Tableau checks these:

* Alert Mechanics:

* Enabled per site (Settings > General > Data-Driven Alerts).

* Backgrounder evaluates conditions against extract data.

* Check Intervals: Configurable via tsm configuration set -k dataAlerts.checkIntervalInMinutes (default: 60 minutes).

* Refresh Trigger: Also checks post-extract refresh for immediate updates.

* Option A (Every 60 minutes): Correct.

* Details: Default interval-Backgrounder polls every hour to evaluate alert conditions.

* Config: Adjustable (e.g., -v 30 for 30 minutes).

* Option D (Whenever extracts in the related workbook are refreshed): Correct.

* Details: An extract refresh updates the data, triggering an immediate alert check to catch changes promptly.

* Why: Ensures timely notifications without waiting for the next poll.

* Option B (Every 10 minutes): Incorrect.

* Why: Not the default-possible via config, but not standard.

* Option C (Whenever a new extract is published): Incorrect.

* Why: Publishing creates the extract; alerts trigger on refreshes or polling, not initial publication.

Why This Matters: Timing affects alert responsiveness-balancing frequency and server load is key.

Reference: Tableau Server Documentation - "Data-Driven Alerts" (https://help.tableau.com/current/server/en-us/data_alerts.htm).

NEW QUESTION # 61

.....

Best practice indicates that people who have passed the Analytics-Admn-201 exam would not pass the exam without the help of the Analytics-Admn-201 study materials. So the study materials will be very important for all people. If you also want to pass the exam and get the related certification in a short, the good study materials are the best choice for you. Now we are going to make an introduction about the Analytics-Admn-201 Study Materials from our company for you. We sincerely hope that our study materials will help you achieve your dream.
