WGU Scripting and Programming Foundations Exam Sample Questions (Q22-Q27):

NEW QUESTION # 22

Which three statements describe a characteristic of a programming library?

- A. A single program can only include one library.
- B. A library typically must be included before any function in the library is used
- C. A single library normally includes more than one function.
- D. Using libraries will always make a program run less efficiently.
- E. Libraries improve a programmer's productivity.
- F. One library will contain one function but can have several variables.

Answer: B,C,E

Explanation:

A programming library is a collection of pre-written code that developers can use to optimize tasks and improve productivity. Here's why the selected statements are correct:

* A: Libraries must be included or imported into your program before you can use the functions or objects they contain. This is because the program needs to know where to find the code it's executing¹².

* B: A library typically includes multiple functions, objects, or classes that are related to a specific task or area of functionality. This allows developers to reuse code efficiently¹².

* D: By providing pre-written code, libraries save developers time and effort, which in turn improves their productivity. Instead of writing code from scratch, developers can focus on the unique aspects of their project¹².

The other options are incorrect because:

* C: While it's true that poorly designed libraries can affect performance, well-designed libraries can actually make programs more efficient by providing optimized code.

* E: A single program can include multiple libraries as needed. There's no limit to the number of libraries a program can use.

* F: Libraries often contain multiple functions and variables, not just one function.

NEW QUESTION # 23

What is put to output by the following flowchart, if the input is 305?

□

- A. interviewBacking
- **B. Interview**
- C. Backlog
- D. Return

Answer: B

Explanation:

The flowchart provided in the image represents a decision-making process based on the input value. Given the input of 305, we follow the flowchart's decision paths. The first decision checks if the input is less than 200, which 305 is not, so we move to the next decision point. The second decision asks if the input is greater than 300. Since 305 is greater than 300, we follow the path for 'yes' which leads us to the output "Interview".

Therefore, the correct output for the input 305 according to the flowchart is "Interview".

References:

* Understanding flowchart symbols and their usage in representing decision-making processes¹.

* Analyzing flowcharts to determine the output based on given input values².

NEW QUESTION # 24

The steps in an algorithm to calculate the positive difference in two given values, x and y, are given in no particular order:

□

What is the first step of the algorithm?

- **A. Deduce variable Diff**
- B. Put Diff to output
- C. Set Diff = x - y
- D. If y > x, set Diff = y - x.

Answer: A

Explanation:

The first step in the algorithm to calculate the positive difference between two given values, x and y, is to declare the variable Diff. This is essential as it initializes the variable that will be used to store the calculated difference between x and y. The subsequent steps involve conditional statements and arithmetic operations that utilize this declared variable to compute and store the positive difference. References: N/A (as per image provided) The image shows steps of an algorithm listed in no particular order for calculating the positive difference between two values, making it relevant for understanding or teaching algorithmic logic and sequence.

NEW QUESTION # 25

Which phase of an Agile approach would create a function that calculates shipping costs based on an item's weight and delivery zip code?

- A. Testing
- B. Analysis
- C. Design
- **D. Implementation**

Answer: D

NEW QUESTION # 26

It is given that integer $x=41$ and integer $y = 16$. What is the value of the expression $(x \% 8) - y$?

- A. 0
- B. 1
- **C. 2**
- D. 3

Answer: C

Explanation:

The expression $((x \% 8) - y)$ involves the modulo operation and subtraction. The modulo operation finds the remainder when (x) is divided by (8) . Given $(x = 41)$, we calculate $(41 \% 8)$ which equals (1) because (41) divided by (8) equals (5) with a remainder of (1) . Then, we subtract (y) (which is (16)) from this remainder: $(41 \% 8) - 16 = 1 - 16 = -15$

However, there seems to be a discrepancy here as the calculation shows the answer should be (-15) , but this is not an option provided in your question. Please double-check the options or the expression provided.
