Topic	Details

Topic 1	<ul style="list-style-type: none"> • Vulnerability Discovery and Analysis: In this section, cybersecurity analysts will learn various techniques to discover vulnerabilities. Analysts will also analyze data from reconnaissance, scanning, and enumeration phases to identify threats. Additionally, it covers physical security concepts, enabling analysts to understand security gaps beyond just the digital landscape.
Topic 2	<ul style="list-style-type: none"> • Engagement Management: In this topic, cybersecurity analysts learn about pre-engagement activities, collaboration, and communication in a penetration testing environment. The topic covers testing frameworks, methodologies, and penetration test reports. It also explains how to analyze findings and recommend remediation effectively within reports, crucial for real-world testing scenarios.
Topic 3	<ul style="list-style-type: none"> • Post-exploitation and Lateral Movement: Cybersecurity analysts will gain skills in establishing and maintaining persistence within a system. This topic also covers lateral movement within an environment and introduces concepts of staging and exfiltration. Lastly, it highlights cleanup and restoration activities, ensuring analysts understand the post-exploitation phase's responsibilities.
Topic 4	<ul style="list-style-type: none"> • Reconnaissance and Enumeration: This topic focuses on applying information gathering and enumeration techniques. Cybersecurity analysts will learn how to modify scripts for reconnaissance and enumeration purposes. They will also understand which tools to use for these stages, essential for gathering crucial information before performing deeper penetration tests.
Topic 5	<ul style="list-style-type: none"> • Attacks and Exploits: This extensive topic trains cybersecurity analysts to analyze data and prioritize attacks. Analysts will learn how to conduct network, authentication, host-based, web application, cloud, wireless, and social engineering attacks using appropriate tools. Understanding specialized systems and automating attacks with scripting will also be emphasized.

CompTIA PenTest+ Exam Sample Questions (Q258-Q263):

NEW QUESTION # 258

A penetration tester needs to test a very large number of URLs for public access. Given the following code snippet:

```
1 import requests
2 import pathlib
4 for url in pathlib.Path("urls.txt").read_text().split("\n"):
5 response = requests.get(url)
6 if response.status == 401:
7 print("URL accessible")
```

Which of the following changes is required?

- A. The condition on line 6
- B. The import on line 1
- C. The delimiter in line 3
- D. The method on line 5

Answer: A

Explanation:

Script Analysis:

Line 1: import requests - Imports the requests library to handle HTTP requests.

Line 2: import pathlib - Imports the pathlib library to handle file paths.

Line 4: for url in pathlib.Path("urls.txt").read_text().split("\n"): - Reads the urls.txt file, splits its contents by newline, and iterates over each URL.

Line 5: response = requests.get(url) - Sends a GET request to the URL and stores the response.

Line 6: if response.status == 401: - Checks if the response status code is 401 (Unauthorized).

Line 7: print("URL accessible") - Prints a message indicating the URL is accessible.

Error Identification:

The condition if response.status == 401: is incorrect for determining if a URL is publicly accessible. A 401 status code indicates that the resource requires authentication.

Correct Condition:

The correct condition should check for a 200 status code, which indicates that the request was successful and the resource is accessible.

Corrected Script:

Replace `if response.status == 401:` with `if response.status_code == 200:` to correctly identify publicly accessible URLs.

NEW QUESTION # 259

A penetration tester wrote the following script on a compromised system:

```
#!/bin/bash
network='10.100.100'
ports='22 23 80 443'
for x in {1 .. 254};
do (nc -zv $network.$x $ports );
done
```

Which of the following would explain using this script instead of another tool?

- A. The typical tools could not be used against Windows systems.
- B. The penetration tester wanted to persist this script to run on reboot.
- C. The configuration required the penetration tester to not utilize additional files.
- D. The Bash script will provide more thorough output.

Answer: C

NEW QUESTION # 260

An Nmap scan shows open ports on web servers and databases. A penetration tester decides to run WPScan and SQLmap to identify vulnerabilities and additional information about those systems.

Which of the following is the penetration tester trying to accomplish?

- A. Limit invasiveness based on scope.
- B. Uncover potential criminal activity based on the evidence gathered.
- C. Identify all the vulnerabilities in the environment.
- D. Maintain confidentiality of the findings.

Answer: A

NEW QUESTION # 261

A client asks a penetration tester to retest its network a week after the scheduled maintenance window.

Which of the following is the client attempting to do?

- A. Determine if the tester was proficient.
- B. Test a new non-public-facing server for vulnerabilities.
- C. Test the efficacy of the remediation effort.
- D. Determine if the initial report is complete.

Answer: C

Explanation:

A retest is a follow-up assessment where the penetration tester checks if the vulnerabilities found in the initial test have been fixed or mitigated by the client. A retest can provide many benefits, such as verifying the effectiveness of the remediation actions, showing improvement to internal or external stakeholders, and reducing the risk of future exploitation. A retest is usually performed after a certain period of time, which can be agreed upon in the rules of engagement or the statement of work. A week after the scheduled maintenance window is a reasonable time frame to allow the client to apply the necessary patches or configuration changes to their network. Therefore, the client is most likely attempting to test the efficacy of the remediation effort by asking for a retest. NEW QUESTION # 262

A security firm has been hired to perform an external penetration test against a company. The only information the firm received was the company name. Which of the following passive reconnaissance approaches would be MOST likely to yield positive initial

results?

- A. Runtime the company's vendor/supply chain.
- B. Specially craft and deploy phishing emails to key company leaders.
- C. Run a vulnerability scan against the company's external website.
- **D. Scrape web presences and social-networking sites.**

Answer: D
