ServiceNow Certified Implementation Specialist - Discovery Sample Questions (Q99-Q104):

NEW QUESTION # 99

Which of the choices below best represent key capabilities of a ServiceNow ITOM Enterprise solution?
(Choose two.)

- A. Build New Apps Fast
- B. Proactively Eliminate Service Outages
- C. Create an Engaging User Experience

- **D. Manage Hybrid Clouds**

Answer: B,D

Explanation:

Based on the web search results from the search_web tool, the following choices best represent key capabilities of a ServiceNow ITOM Enterprise solution:

* **Manage Hybrid Clouds:** ServiceNow ITOM enables organizations to gain visibility into their IT environment, on-premises to cloud, and see the impact of their applications on business services¹². It also helps to plan, track, and secure cloud implementation through best-practice governance¹. Four apps comprise Cloud Accelerate to help prepare for cloud migration, streamline provisioning requests, and manage cloud resources¹.

* **Proactively Eliminate Service Outages:** ServiceNow ITOM helps to predict issues, reduce user impact, and automate resolutions with predictive AIOps and automation¹³. It analyzes telemetry and log data using AI to reduce noise, expedite mapping and predict issues¹. It also delivers proactive digital operations with real-time log data to solve problems quickly¹.

The other choices are not specific to ServiceNow ITOM Enterprise solution, but rather general features of the ServiceNow platform. The ServiceNow platform allows users to create an engaging user experience with intuitive interfaces and workflows. It also enables users to build new apps fast with low-code development tools and pre-built components.

NEW QUESTION # 100

Which of the below choices are kinds of variables used in discovery patterns? (Choose three.)

- A. Fixed
- **B. Global**
- C. Prefix
- **D. Temporary**
- **E. CI attributes**

Answer: B,D,E

Explanation:

Variables are used in discovery patterns to store and manipulate data that is collected or calculated during the discovery process.

There are three kinds of variables used in discovery patterns¹²:

* **CI attributes:** These are variables that correspond to the attributes of the configuration item (CI) type that the pattern is discovering. For example, name, serial_number, manufacturer, etc. CI attributes are used to populate the CI record in the CMDB with the information gathered by the pattern.

* **Temporary:** These are variables that are created and used within the pattern, but are not stored in the CMDB. For example, \$result, \$output, \$user_var, etc. Temporary variables are used to store and manipulate data such as the output of a command, the value of a parameter, or the result of a calculation.

* **Global:** These are variables that are defined in the global scope and can be accessed by any pattern. For example, \$mid, \$target, \$ip_address, etc. Global variables are used to store and access data that is common to all patterns, such as the MID Server, the target device, or the IP address.

NEW QUESTION # 101

Which of the below choices are needed for Quick Discovery? (Choose two.)

- A. Discovery Schedule
- B. PID
- **C. Target IP**
- **D. MID Server**

Answer: C,D

Explanation:

Quick Discovery is a wizard that helps you get up and running with Discovery quickly. It discovers both physical and logical

components, including virtual machines, servers, storage, databases, applications, and more. To use Quick Discovery, you need to have a MID Server installed and configured, and provide a target IP range or subnet to scan. You do not need to create a Discovery Schedule or a PID for Quick Discovery.

NEW QUESTION # 102

What would you see in the Discovery pattern log that you would not see in the ECC Queue?

- A. Shazzam probe payload
- B. Relationships created
- C. Payload of CI attributes and relationships
- D. Success or failure of the individual pattern steps

Answer: D

Explanation:

The Discovery pattern log is a log that records the execution of a pattern during Discovery or Service Mapping¹. It shows the success or failure of the individual pattern steps, as well as the input and output variables, the CI attributes and relationships, and the errors or warnings². The ECC Queue is a table that displays the input and output messages from and to MID Servers³. It shows the payload of CI attributes and relationships, the Shazzam probe payload, and the relationships created, but not the success or failure of the individual pattern steps⁴. The success or failure of the individual pattern steps is specific to the Discovery pattern log and can be used to debug or troubleshoot the pattern execution².

NEW QUESTION # 103

What role is needed by the MID Server's user account to interact with a ServiceNow instance?

- A. discovery_admin
- B. mid_server
- C. sm_mid
- D. mid_discovery

Answer: B

Explanation:

The MID Server's user account must have the mid_server role to interact with a ServiceNow instance. This role allows the MID Server to access protected tables and perform discovery and orchestration tasks on behalf of the instance. The other roles are not related to the MID Server functionality. The discovery_admin role is for configuring and managing discovery, the sm_mid role is for using the Service Mapping MID Server, and the mid_discovery role is for running discovery probes and sensors.
