## Salesforce - AP-202 - B2B Commerce for Developers Accredited Professional – Trustable Valid Dumps

Now it is wise choice for you to choose our AP-202 actual test guide materials. Valid exam questions help you study and prepare double results with half works. You will get high-quality 100% pass rate AP-202 learning prep so that you can master the key knowledge and clear exam easily. You can Pass AP-202 Exam in the shortest time and obtain a certification soon. It will benefit you more. Instead of admiring others' redoubtable life, start your new life from choosing valid test dumps. Our AP-202 actual test guide is the pass king in this field which will be the best option for you.

## Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q89-Q94):

### NEW QUESTION # 89

What are two purposes of the Shadow DOM in a Lightning web component?

- A. It allows older JavaScript libraries to manipulate the tagging structure
- B. It allows components to be shared while protecting them from being manipulated by arbitrary code
- C. It encapsulates the internal document object model (DOM) structure of a web component
- D. It allows direct access to the document object model of the component

**Answer: B,C**

Explanation:

According to the Lightning Web Components Developer Guide, Shadow DOM is a standard that encapsulates the internal document

object model (DOM) structure of a web component. Encapsulating the DOM gives developers the ability to share a component and protect the component from being manipulated by arbitrary HTML, CSS, and JavaScript. Shadow DOM also provides style and behavior isolation for a web component, which means that the styles and scripts defined inside a component do not affect the rest of the page, and vice versa. Therefore, the purposes of the Shadow DOM in a Lightning web component are to encapsulate the internal DOM structure of a web component (A) and to allow components to be shared while protecting them from being manipulated by arbitrary code (B). The other options are incorrect because Shadow DOM does not allow direct access to the document object model of the component, nor does it allow older JavaScript libraries to manipulate the tagging structure (D). Lightning Web Components Developer Guide, Understand the Shadow DOM Unit

## NEW QUESTION # 90

Which two methods from the platformResourceLoader module are relevant for including third party JavaScript and CSS in a Lightning web component?

- A. loadScript
- B. loadStyle
- C. loadCss
- D. loadClientScript

**Answer: A,B**

Explanation:

Two methods from the platformResourceLoader module that are relevant for including third party JavaScript and CSS in a Lightning web component are loadScript and loadStyle. The platformResourceLoader module is a module that provides methods for loading JavaScript or CSS files from static resources or external URLs into a Lightning web component. The loadScript method is used to load a JavaScript file and execute it in the component. The loadStyle method is used to load a CSS file and apply it to the component. The loadClientScript method does not exist or is not relevant for including third party JavaScript in a Lightning web component. The loadCss method does not exist or is not relevant for including third party CSS in a Lightning web component. ## NEW QUESTION # 91

Universal Containers (UC) is ready to build a tax provider class using the interfaces available in the Buyer Experience SDK. When creating a tax provider, what are three things that a developer should consider first?

- A. What to implement
- B. WhethertouseJSONOrXML
- C. How to handle results
- D. Steps to complete in the Tax Service
- E. What events to fire in the Lightning web component

**Answer: A,C,D**

Explanation:

When creating a tax provider, three things that a developer should consider first are: steps to complete in the tax service, how to handle results, and what to implement. Steps to complete in the tax service are the actions that the developer needs to perform to connect to and use the third-party tax service provider's API or service. These steps may include authentication, authorization, request formatting, response parsing, error handling, and logging. How to handle results are the actions that the developer needs to perform to process and apply the tax calculation results from the tax service to the cart or order. These actions may include creating or updating cart items with type of Charge and charge type of Tax, applying tax adjustments or exemptions, and displaying tax amounts and details on the storefront. What to implement are the methods that the developer needs to define in their custom Apex class that implements the sfdc\_checkout.TaxCalculations interface. The interface provides methods for customizing the tax calculation logic for a cart or an order, such as getTaxRatesAndRules, applyTaxAmountsAndAdjustments, and handleTaxErrorsAndExceptions. Whether to use JSON or XML is not something that the developer should consider first, as it is not a critical or relevant factor for creating a tax provider. It may depend on the format that the tax service provider supports or prefers, but it does not affect the overall functionality or performance of the tax integration. What events to fire in the Lightning web component is not something that the developer should consider first either, as it is not related to creating a tax provider. It may be an optional feature that the developer can add to enhance the user interface or user experience of their storefront, but it does not affect the core logic or functionality of the tax integration. ## NEW QUESTION # 92

Which three steps are necessary to have subscriberpage added to Salesforce B2B Commerce after creating a custom Visualforce page? (3 answers)

- A. Enable the Subscriber Page in CC Admin.
- B. Refresh the Page Keys Index in CC Admin.
- C. Create a new Visualforce page, and manually import the Salesforce B2BCommerce JavaScript libraries. Run in Anonymous Apex ccrzcc\_util\_Reflection.upsertPageUIKey([arg1],[arg2],[arg3]);
- D. Create a new CC Subscriber Page record that points to your custom Visualforce page.

**Answer: A,B,D**

Explanation:

Three steps that are necessary to have a subscriber page added to Salesforce B2B Commerce after creating a custom Visualforce page are:

Create a new CC Subscriber Page record that points to your custom Visualforce page. This record will store information about the subscriber page, such as the name, description, URL, and Visualforce page. For example, you can create a new record named MySubscriberPage that points to your custom Visualforce page named MyPage.

Refresh the Page Keys Index in CC Admin. This action will update the page keys index, which is a cache that stores the mapping between the page keys and the subscriber pages. You need to do this whenever you create or modify a subscriber page record.

Enable the Subscriber Page in CC Admin. This action will allow you to select the subscriber page from the CC Page Settings configuration and assign it to a CC Page. For example, you can enable MySubscriberPage and assign it to the Home page.

## NEW QUESTION # 93

A query containing a subquery is executed. What is appended to the subquery name as part of its transformation by default in Salesforce B2B Commerce?

- A. A subscriber-supplied token
- B. "\_ccrz"
- C. The letter "S"
- D. The "\*" symbol

**Answer: B**

Explanation:

A query containing a subquery is executed. By default, in Salesforce B2B Commerce, "\_ccrz" is appended to the subquery name as part of its transformation. This is done to avoid conflicts with the standard Salesforce fields and relationships. For example,SELECT Id, Name, (SELECT Id, Name FROM Contacts) FROM Account will be transformed toSELECT Id, Name, (SELECT Id, Name FROM Contacts\_ccrz) FROM Account\_ccrz. Salesforce B2B Commerce and D2C Commerce Developer Guide,Query Transformation

## NEW QUESTION # 94
