It is very normal to be afraid of the exam, especially such difficult exam like Analytics-Admn-201 exam. We know that encouragement alone cannot really improve your confidence in exam, so we provide the most practical and effective test software to help you pass the Analytics-Admn-201 Exam. You can use our samples first to experience the effect of our software, and we believe that you can realize our profession and efforts by researching and developing Analytics-Admn-201 exam software from samples of Analytics-Admn-201.

Salesforce Analytics-Admn-201 Exam Syllabus Topics:

Topic	Details
Topic 1	• Installation and Configuration: This section of the exam measures the skills of Server Engineers and covers the process of installing Tableau Server, understanding installation paths, identity store options, SSO integrations, SSL setup, and silent installs. Candidates also need to demonstrate the ability to configure Tableau Server by setting cache, distributing processes, customizing sites, and configuring user quotas. It further includes adding users, managing their roles and permissions, and applying Tableau's security model at different levels from sites to workbooks.
Topic 2	• Migration & Upgrade: This section of the exam measures the skills of System Engineers and covers the process of upgrading and migrating Tableau Server environments. Candidates should understand how to carry out clean reinstalls, migrate servers to new hardware, and maintain backward compatibility during the process.

Topic 3	Connecting to and Preparing Data: This section of the exam measures the skills of Tableau Administrators and covers the basic understanding of Tableau Server's interface, navigation, and overall topology. Candidates are expected to recognize both client and server components, understand how these interact, and know where to find information about versions, releases, and updates. It also focuses on system requirements, including hardware, operating systems, browsers, email configurations, cloud considerations, and licensing models. Additionally, it examines knowledge of server processes, data source types, network infrastructure, and ports needed for a stable deployment.
Topic 4	Troubleshooting: This section of the exam measures the skills of Support Specialists and covers resolving common Tableau Server issues. Candidates must know how to reset accounts, package logs, validate site resources, rebuild search indexes, and use analysis reports. It also includes understanding the role of browser cookies and creating support requests when needed.
Topic 5	Administration: This section of the exam measures the skills of Tableau Administrators and covers the day-to-day tasks of maintaining Tableau Server. Candidates should understand how to create and manage schedules, subscriptions, backups, and restores, as well as how to use tools such as TSM, Tabcmd, and REST API. It emphasizes monitoring, server analysis, log file usage, and embedding practices. It also includes managing projects, sites, and nested structures, while contrasting end-user and administrator abilities. Knowledge of publishing, web authoring, sharing views, caching, and data source certification is also tested.

Valid Analytics-Admn-201 Exam Tips & Analytics-Admn-201 Official Cert Guide

Nowadays passing the Analytics-Admn-201 test certification is extremely significant for you and can bring a lot of benefits to you. Passing the Analytics-Admn-201 test certification does not only prove that you are competent in some area but also can help you enter in the big company and double your wage. And our Analytics-Admn-201 Exam Questions are in good quality. As long as you study with our Analytics-Admn-201 learning guide, you will find that the content is easily to understand and the displays are enjoyable.

Salesforce Certified Tableau Server Administrator Sample Questions (Q20-Q25):

NEW QUESTION # 20

What is the minimum hardware recommendation for a single-node production installation of Tableau Server?

- A. 4-Core CPU (2.0 GHz or higher), 64 GB RAM, 50 GB free disk space
- B. 4-Core CPU (2.0 GHz or higher), 16 GB RAM, 50 GB free disk space
- C. 2-Core CPU (1.8 GHz or higher), 8 GB RAM, 15 GB free disk space
- D. 8-Core CPU (2.0 GHz or higher), 32 GB RAM, 50 GB free disk space

Answer: D

Explanation:

Tableau Server's minimum hardware recommendations for a production single-node deployment ensure reliable performance for small to medium workloads. As of the latest documentation:

- * CPU: 8 cores (2.0 GHz or higher) to handle concurrent users, rendering, and background tasks.
- * RAM: 32 GB to support in-memory processing (e.g., VizQL, Data Engine) and caching.
- * Disk Space: 50 GB free for installation, logs, extracts, and temporary files.

Let's break it down:

- * Option C (8-Core CPU, 32 GB RAM, 50 GB free disk space): Correct. This matches Tableau's official minimum for production:
- * 8 cores ensure sufficient parallelism for processes like Backgrounder and VizQL.
- * 32 GB RAM supports multiple users and extract refreshes.
- * 50 GB disk space accommodates growth (initial install is ~1-2 GB, but logs and extracts expand).
- * Option A (4-Core, 16 GB RAM, 50 GB): Incorrect. Too low for production-4 cores and 16 GB RAM are below the threshold

for reliable performance under load.

* Option B (2-Core, 8 GB RAM, 15 GB): Incorrect. This is for non-production (e.g., trial) setups, insufficient for production stability.

* Option D (4-Core, 64 GB RAM, 50 GB): Incorrect. 4 cores are inadequate, though 64 GB RAM exceeds the minimum (32 GB). Why This Matters: Under-spec hardware can lead to slow performance, failed refreshes, or crashes in production-adhering to the minimum ensures stability.

Reference: Tableau Server Documentation - "Minimum Hardware Recommendations" (<https://help.tableau.com/current/server/en-us/requirements.htm>).

NEW QUESTION # 21

Which three types of authentications can you use to implement single-sign-on (SSO) authentication to Tableau Server? (Choose three.)

- A. OpenID Connect
- B. Local Authentication
- C. Security Assertion Markup Language (SAML)
- D. Kerberos with Active Directory

Answer: A,C,D

Explanation:

Single Sign-On (SSO) allows users to authenticate once (e.g., via a corporate identity provider) and access Tableau Server without re-entering credentials. Tableau Server supports several SSO methods:

* OpenID Connect (OIDC): An OAuth 2.0-based protocol for SSO, configured via Tableau's SAML settings with an OIDC-compatible IdP (e.g., Google, Okta).

* Kerberos with Active Directory: A ticket-based SSO protocol, widely used in Windows environments with AD integration.

* SAML: A flexible SSO standard using XML assertions, supporting various IdPs (e.g., ADFS, PingFederate).

Let's evaluate:

* Option A (OpenID Connect): Correct. OIDC is an SSO method, implemented as a SAML variant in Tableau Server, enabling seamless login.

* Option C (Kerberos with Active Directory): Correct. Kerberos provides SSO in AD environments, delegating authentication to the domain controller.

* Option D (Security Assertion Markup Language - SAML): Correct. SAML is a core SSO method in Tableau, widely adopted for enterprise integrations.

* Option B (Local Authentication): Incorrect. Local Authentication uses Tableau's internal user database, requiring manual credential entry-no SSO support.

Why This Matters: SSO enhances user experience and security by leveraging existing identity systems, reducing password fatigue.

Reference: Tableau Server Documentation - "Authentication" (https://help.tableau.com/current/server/en-us/auth_overview.htm).

NEW QUESTION # 22

Which two operating systems are supported for a Tableau Server installation? (Choose two.)

- A. Windows Server 2019
- B. Windows 7
- C. Windows 10
- D. Windows Server 2016

Answer: A,D

Explanation:

Tableau Server is designed for production environments and is supported only on server-class operating systems, not desktop operating systems. As of the latest documentation (aligned with knowledge up to March 21, 2025), the supported operating systems for Tableau Server on Windows are:

Windows Server 2016

Windows Server 2019

Windows Server 2022 (added in later versions, but relevant as of 2025).

Desktop operating systems like Windows 7 or Windows 10 are not supported for production installations due to stability, security, and performance requirements.

Option A (Windows 7): Incorrect. Windows 7 is a desktop OS and is not supported for Tableau Server. It's also end-of-life as of January 2020.

Option B (Windows 10): Incorrect. Windows 10 is a desktop OS and not supported for production Tableau Server deployments, though it may be used for testing in non-production scenarios.

Option C (Windows Server 2019): Correct. This is a supported server OS for Tableau Server.

Option D (Windows Server 2016): Correct. This is also a supported server OS for Tableau Server.

Reference: Tableau Server Documentation - "System Requirements for Tableau Server" (<https://help.tableau.com/current/server/en-us/requirements.htm>).

NEW QUESTION # 23

Which two commands are valid and complete commands? (Choose two.)

- A. tsm maintenance backup
- B. tsm maintenance ziplogs
- C. tsm maintenance restore
- D. tsm maintenance cleanup

Answer: B,D

Explanation:

TSM commands manage Tableau Server maintenance-let's validate their syntax:

* Command Requirements:

* Some need arguments (e.g., file paths); others are standalone.

* Valid and Complete: Must work as-is without errors.

* Option C (tsm maintenance cleanup): Correct.

* Details: Removes temporary files and old logs-no arguments required (optional flags like -l exist).

* Use: tsm maintenance cleanup-runs fully.

* Option D (tsm maintenance ziplogs): Correct.

* Details: Creates a zip of logs (e.g., tsm-logs.zip)-no arguments needed (optional -d for date range).

* Use: tsm maintenance ziplogs-complete and valid.

* Option A (tsm maintenance backup): Incorrect.

* Why: Requires -f <filename>.tsbak (e.g., tsm maintenance backup -f backup.tsbak)-incomplete without it.

* Option B (tsm maintenance restore): Incorrect.

* Why: Needs -f <filename>.tsbak (e.g., tsm maintenance restore -f backup.tsbak)-not standalone.

Why This Matters: Correct syntax ensures maintenance tasks execute without errors-critical for server health.

Reference: Tableau Server Documentation - "TSM Maintenance Commands" (https://help.tableau.com/current/server/en-us/cli_maintenance_tsm.htm).

NEW QUESTION # 24

What should you do to disable table recommendations for popular data sources and tables to users?

- A. Disable the option using the server Settings page
- B. Use the command: tsm configuration set -k recommendations.enabled -v false
- C. Disable the option using the site Settings page
- D. Publish data sources only to projects with permissions locked to the project

Answer: C

Explanation:

Table recommendations in Tableau Server suggest popular tables and data sources to users when they create new content in the web authoring environment. This feature is enabled by default but can be disabled at the site level.

Option A (Disable the option using the site Settings page): Correct. A site administrator can disable table recommendations by navigating to the site's Settings > General page in the Tableau Server web interface and unchecking the option "Enable table recommendations." This prevents users on that site from seeing these suggestions, offering a straightforward UI-based solution.

Option B (Use the command: tsm configuration set -k recommendations.enabled -v false): Incorrect. There is no recommendations.enabled key in the TSM configuration settings. This feature is managed per site, not server-wide via TSM.

Option C (Publish data sources only to projects with permissions locked): Incorrect. Locking permissions restricts access but doesn't disable the recommendation feature itself. Users with access would still see recommendations.

Option D (Disable the option using the server Settings page): Incorrect. Table recommendations are a site-specific setting, not a

Reference: Tableau Server Documentation - "Manage Site Settings" (https://help.tableau.com/current/server/en-us/site_settings.htm).
