The 3V0-21.23 study guide to good meet user demand, will be a little bit of knowledge to separate memory, every day we have lots of fragments of time. The 3V0-21.23 practice dumps can allow users to use the time of debris anytime and anywhere to study and make more reasonable arrangements for their study and life. Choosing our 3V0-21.23 simulating materials is a good choice for you, and follow our step, just believe in yourself, you can do it perfectly!

VMware 3V0-21.23 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> VMware Products and Solutions: Targeting VMware Engineers, this section describes VMware Cloud Foundation architecture, its components like vSphere and NSX, benefits such as automation and scalability, and use cases like hybrid cloud environments. It assesses understanding of VMware Validated Solutions.
Topic 2	<ul style="list-style-type: none"> Plan and Design the VMware Solution: This part targets Solution Designers, evaluating their ability to gather business objectives, create conceptual models based on these objectives, develop logical designs, and translate them into physical designs that meet specific requirements like manageability or security.
Topic 3	<ul style="list-style-type: none"> IT Architectures, Technologies, Standards: This section of the exam measures the skills of IT Architects and covers differentiating between business and technical requirements, as well as conceptual, logical, and physical design. A key skill measured is "Designing System Availability."

VMware vSphere 8.x Advanced Design Sample Questions (Q88-Q93):

NEW QUESTION # 88

An architect is tasked with designing the VMware Validated Solutions in an existing VMware Cloud Foundation environment. The design must meet the following requirements:

Must not allow logical networks to span physical network boundaries or locations
Must support static routing
What should the architect recommend based on these requirements?

- A. A dedicated NSX segment configured manually
- B. Overlay-backed NSX segments
- C. A dedicated distributed virtual switch and dedicated port groups
- D. VLAN-backed NSX segments

Answer: D

Explanation:

VLAN-backed NSX segments meet the requirement of ensuring that logical networks do not span physical network boundaries because VLANs are inherently limited to a single physical network segment. Each VLAN maps to a specific Layer 2 broadcast domain and can be isolated to particular physical network segments, ensuring that no logical network spans across physical boundaries. Additionally, static routing is supported with VLAN-backed segments, providing the flexibility needed to configure routing between different subnets or networks.

NEW QUESTION # 89

An architect is planning the physical server configuration for a vSAN-based infrastructure.

Which operations mode should a RAID controller support to minimize potential server downtime during physical disk failures?

- A. RAID controller with RAID 6 mode
- B. RAID controller with RAID 10 mode
- C. RAID controller with Passthru mode
- D. RAID controller with RAID 5 mode

Answer: C

NEW QUESTION # 90

Application owners require support of a Microsoft Windows Server Failover Cluster (WSFC).

Their current environment consists of the following components:

- vSphere 7.0 and vSAN 7.0
- External array supporting NFS 3.0/4.1, Server Message Block (SMB) 2.1
- 10 GbE storage connectivity for all devices

The solution architect is tasked with coming up with a solution to meet this requirement while utilizing their existing investments.

Which two recommendations could the architect make? (Choose two.)

- A. Run WSFC on vSAN iSCSI Target Service
- B. Use raw device mapping (RDM)
- C. Use NFS 4.1 shares for quorum and shared disk
- D. Use the SMB 2.1 protocol for sharing disks
- E. Use vSAN native support for WSFC

Answer: A,E

NEW QUESTION # 91

An architect is designing the virtual networking components of a vSphere-based solution that will provide an environment for the

development of a new latency sensitive stock trading application.

The following information was identified within the initial meeting with the customer:

The customer has vCenter Standard and vSphere Standard licenses left over from a previous project.

The customer's CFO has approved budget for additional purchases, if required.

The following requirements were also identified during the meeting:

The solution must support 500 development workloads concurrently running in the secondary site.

The solution must support the ability to complete all vSphere Operational Management centrally.

The solution must ensure business-critical applications are not impacted by vSphere system-level operations.

Given the requirements, the architect has decided on a single 20-node cluster for development.

Which three additional design decisions should the architect make to meet these requirements? (Choose three.)

- A. The solution will deploy VMware vSphere Standard on all hosts within the cluster.
- B. The solution will configure Traffic Shaping policies to restrict network bandwidth on ingress and egress.
- **C. The solution will deploy a single vSphere Distributed Switch with each host connected to it.**
- D. The solution will deploy a single VMware Standard Switch that will be configured identically on each host.
- **E. The solution will deploy VMware vSphere Enterprise Plus on all hosts within the cluster.**
- **F. The solution will configure Network I/O control to ensure that system-level bandwidth does not impact workload network traffic.**

Answer: C,E,F

Explanation:

The solution will deploy VMware vSphere Enterprise Plus on all hosts within the cluster.

VMware vSphere Enterprise Plus offers advanced networking and storage features that will support the required high availability, performance, and management capabilities. Features such as Distributed Switches and Network I/O Control (NIOC) are critical to meeting the business-critical application and performance requirements for the latency-sensitive stock trading application.

The solution will deploy a single vSphere Distributed Switch with each host connected to it.

A vSphere Distributed Switch (VDS) is ideal for managing network configurations centrally across multiple hosts, which meets the requirement for centralized vSphere operational management. It also ensures consistent network configurations and simplifies network management at scale.

The solution will configure Network I/O control to ensure that system-level bandwidth does not impact workload network traffic.

Network I/O Control (NIOC) is essential for prioritizing network traffic, ensuring that latency-sensitive workloads are not impacted by other system-level or less critical traffic. This is crucial for the performance requirements of the stock trading application.

NEW QUESTION # 92

A customer is deploying a new cluster and wants to be able to patch and update two hosts in parallel. The cluster must be able to maintain N+1 resiliency across the remaining hosts while patching activities are performed. The current expected utilization of the platform requires a minimum of two hosts to support all of the virtual machines.

What is the minimum number of hosts the customer will require in the cluster in order to meet the required resiliency level?

- A. Seven
- **B. Five**
- C. Four
- D. Six

Answer: B

Explanation:

cluster must be able to maintain N+1

current expected utilization of the platform requires a minimum of two hosts to support all of the virtual machines.

So, we need 3 hosts to support N+1.

Customer wants to be able to patch and update two hosts in parallel.

So that means 5 hosts are required.
