Peoplecert PeopleCert DevOps Site Reliability Engineer (SRE) Sample Questions (Q44-Q49):

NEW QUESTION # 44

Which of the following describes work that would be considered "toil"?

- A. Work that is devoid of enduring value
- B. Engineering work to add service features
- C. Engineering work that does not add enduring value
- D. Work that has some enduring value but requires manual tasks

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

"Toil" in SRE has a very specific meaning. According to the Site Reliability Engineering Book, Chapter "Eliminating Toil":

"Toil is the kind of work tied to running a production service that tends to be manual, repetitive, automatable, tactical, has no enduring value, and scales linearly as the service grows." The key phrase is "no enduring value." Toil does not produce lasting improvement, even though it may be necessary in the short term. It consumes engineering effort without making the system better over time.

Why the other options are incorrect:

* B Work that has some enduring value cannot be classified as toil by definition.

* C Engineering work that adds service features is explicitly non-toil, because SRE defines feature work as "project work," not operational toil.

* D Seems close but is misleading: engineering work without enduring value is poor engineering, not necessarily toil. Toil refers to operations workload specifically.

Thus, A is the correct and precise definition of toil.

NEW QUESTION # 45

Which of the following BEST describes the capabilities and scope of DevOps continuous monitoring?

- A. The use of multiple monitoring tools and an eventmanagement process for all applications
- B. The combination of tools and the process for a rapid incident detection and response of cloud services
- C. The application of widespread system event monitoring by automating the end user transactions
- D. The deployment of a set of integrated monitoring tools and event thresholds for infrastructure

Answer: D

NEW QUESTION # 46

Which of the following features of Puppet Labs is described as the ability to locate, identify, and group cloud nodes?

- A. Insight
- B. Provisioning
- C. Delivery
- **D. Discovery**

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In the context of SRE tooling and automation, configuration management platforms like Puppet support large-scale infrastructure reliability by enabling consistency, repeatability, and automation. Puppet's Discovery capability allows engineers to automatically locate, identify, classify, and group cloud nodes or infrastructure resources. Although not directly from Google's SRE Book, Discovery aligns with SRE principles of reducing toil and enabling scalable automation. SRE emphasizes "automating away the manual work of locating and managing infrastructure at scale." (SRE Book - Chapter: Eliminating Toil). Puppet Discovery does precisely this by automatically scanning environments, detecting nodes, and providing metadata to group or manage them.

Option A (Provisioning) refers to creating infrastructure, not identifying it.

Option B (Delivery) relates to CI/CD processes.

Option D (Insight) relates to analytics and reporting, not node identification.

Therefore, C. Discovery is correct as it directly represents the capability described.

- A. Prevent introduction of significant bugs
- B. Shift the locus toward more innovation
- C. Send alerts when error budget is at half
- **D. Decide when and how to intervene**

Answer: D

NEW QUESTION # 48

Which of the following BEST identifies a desired objective of the production readiness review (PRR)?

- **A. To validate the service meets international quality standards and frameworks**
- B. To improve the reliability of the service in the development and testing environment
- C. To ensure the service is ready for an SRE team to take over support and care for it
- D. To ensure the service owner transitions operational accountability to the SRE team

Answer: A
