In the complicated and changeable information age, have you ever been tried hard to find the right training materials of Cybersecurity-Architecture-and-Engineering exam certification? We feel delighted for you to find TestKingIT, and more delighted to find the reliable Cybersecurity-Architecture-and-Engineering Exam Certification training materials. It will help you get your coveted Cybersecurity-Architecture-and-Engineering exam certification.

WGU Cybersecurity Architecture and Engineering (KFO1/D488) Sample Questions (Q39-Q44):

NEW QUESTION # 39

Which risk management strategy will help prevent cheating using a learning management system as a platform?

- A. Configuration of the system to disable all Bluetooth services on all workstations
- **B. Implementation of secure user authentication protocols**
- C. Enforcement of a strict firewall policy to restrict access to the system's server
- D. Implementation of regular software updates and patch management

Answer: B

Explanation:

Preventing unauthorized access and impersonation during exams or coursework is critical in e-learning platforms. Strong user authentication (e.g., MFA, CAPTCHA, secure login mechanisms) ensures that only authorized users access exams and coursework. NIST SP 800-63B (Digital Identity Guidelines - Authentication):

"Secure user authentication ensures the identity of individuals accessing sensitive applications, reducing the risk of impersonation and credential misuse." Firewall rules and patching are important, but they don't directly address user-level fraud prevention.

#WGU Course Alignment:

Domain: Access Control and Identity Management

Topic: Secure authentication mechanisms for web platforms

NEW QUESTION # 40

What is scope creep?

- A. Realization that the organization staffing is inadequate
- B. When the project is completed in less than the required time
- **C. Small changes in a project that lead to bigger changes**
- D. The extent of the project that lacks needed requirements

Answer: C

Explanation:

Scope creep refers to the phenomenon where the scope of a project gradually increases over time due to small, incremental changes that were not initially planned or approved. This can happen when:

- * New features or requirements are added without proper evaluation or approval.
- * Stakeholders continuously request small changes or additions.
- * Lack of a clear scope definition and change control process.

These small changes can accumulate, leading to significant deviations from the original project plan, affecting the project's schedule, budget, and overall success.

NEW QUESTION # 41

A company may choose to use CDs, DVDs, hard drives, or even cloud storage for data backup.

Which aspect of data backup does this statement describe?

- A. Image backups

- B. Data mirroring
- C. Incremental backups
- D. **Backup media**

Answer: D

Explanation:

The statement refers to the different types of media that can be used for data backup. Backup media encompasses various storage devices and methods used to store copies of data. Examples include:

- * CDs and DVDs: Optical storage media used for smaller-scale backups.
- * Hard drives: Mechanical or solid-state drives used for local and external backups.
- * Cloud storage: Online services providing remote storage and access to backups.

Choosing the appropriate backup media is crucial for ensuring data availability and recovery in case of data loss.

NEW QUESTION # 42

Which characteristic applies to machine-level languages?

- A. They use collection of short scripts
- B. They use language translators known as compilers
- C. They use cables to connect circuits
- D. **They use language translators known as assemblers**

Answer: D

Explanation:

Machine-level languages, also known as assembly languages, are low-level programming languages that are closely related to machine code.

- * Definition: Machine-level languages consist of instructions that are directly executed by a computer's CPU.
- * Assemblers: An assembler is a tool that translates assembly language code into machine code.
- * Characteristics: Assembly languages are specific to a computer architecture and provide a way to write programs that can be executed by the hardware directly.

NEW QUESTION # 43

An engineer has noticed increased network traffic originating from an unknown internet protocol (IP) address.

Which action should be taken to analyze the unusual network traffic patterns?

- A. Rate limit incoming traffic from the unknown IP address
- B. Temporarily block all incoming traffic from the unknown IP address
- C. Permanently block all incoming traffic from the unknown IP address
- D. **Compare the unknown address to known IP addresses to determine if it is a threat**

Answer: D

Explanation:

The correct answer is B - Compare the unknown address to known IP addresses to determine if it is a threat.

According to WGU Cybersecurity Architecture and Engineering (KFO1 / D488), proper threat analysis requires identifying and verifying whether an unknown source is malicious before taking action. Comparing the IP address against known threat databases or intelligence feeds allows the organization to make informed decisions.

Permanently blocking (A) or temporarily blocking (C) without analysis could cause disruption if the IP is legitimate. Rate limiting (D) reduces traffic but does not determine threat status.

Reference Extract from Study Guide:

"Effective incident analysis begins by verifying and classifying the suspicious activity, including checking unknown IP addresses against threat intelligence sources."
