

# Free Data-Architect Practice Exams, Answers Data-Architect Real Questions

## 100% Pass Quiz 2023 Salesforce Perfect Data-Architect: Salesforce Certified Data Architect Simulation Questions

Every questions of our Data-Architect test engine are written and technically tested by our IT professionals, Our company boosts three versions of products right now.

And we will let you see details of the transaction, In the end, you will be very easily to yield good results after you have used our Data-Architect sure-pass materials.

Because our dumps can solve all difficult problems **Data-Architect Simulation Questions** you encounter in the process of preparing for the exam. If you have difficulty in gaining the latest information when you are preparing for the Data-Architect, it will be not easy for you to pass the exam and get the related certification in a short time.

Excellent technical assistance, You just need to **Data-Architect Simulation Questions** check your mail and change your learning methods in accordance with new changes, The Data-Architect study materials of our company is the study tool **Data-Architect Practice Exams Free** which best suits these people who long to pass the exam and get the related certification.

Our website are specialized in the latest Data-Architect valid dumps for decades, you can find the best useful and latest study training material for Data-Architect exam preparation.

## Data-Architect - The Best Salesforce Certified Data Architect Simulation Questions

If you flunk the test unluckily, which is so rare to users choosing our Data-Architect study guide materials, we give back your full refund as compensation.

### NEW QUESTION 42

UC is having issues using Informatica Cloud Louder to export +10MOrder records. Each Order record has 10 Order Line Items. What two steps can you take to help correct this? Choose two answers.

- A. Export in multiple batches
- B. Limit Batch to 10K records
- C. Export Bulk API in parallel mode
- D. Use PK Chunking

Answer: A,D

### NEW QUESTION 43

Universal Containers (UC) has adopted Salesforce as its primary sales automated tool. UC has 100,000 customers with a growth rate of 10% a year, UC uses an on-premise web-based billing and invoice system that generates over 1 million invoices a year supporting a monthly billing cycle. The UC sales team needs to be able to pull a customer record and view their account status, Invoice

As customer-oriented company, we believe in satisfying the customers at any costs. Instead of focusing on profits, we determined to help every customer harvest desirable outcomes by our Data-Architect training materials. So our staff and after-sales sections are regularly interacting with customers for their further requirements and to know satisfaction levels of them. We want to finish long term objectives through customer satisfaction and we have achieved it already by our excellent Data-Architect Exam Questions. In this era of cut throat competition, we are successful than other competitors. What is more, we offer customer services 24/7. Even if you fail the exams, the customer will be reimbursed for any loss or damage after buying our Data-Architect guide dump. One decision will automatically lead to another decision, we believe our Data-Architect guide dump will make you fall in love with our products and become regular buyers.

Salesforce Certified Data Architect certification is a highly respected credential in the industry. It demonstrates that the holder has the knowledge and skills required to design and implement complex data architecture solutions on the Salesforce platform. Salesforce Certified Data Architect certification exam covers a wide range of topics, including data modeling, data integration, data security, and data governance.

Salesforce Data-Architect certification is a highly sought-after certification that validates a professional's expertise in designing, building, and managing complex data architectures in Salesforce. Salesforce Certified Data Architect certification is designed to ensure that professionals have a deep understanding of the Salesforce platform's data model, data integration, and data management

capabilities. The Salesforce Data-Architect Certification is intended for professionals who work with large-scale data architectures and want to showcase their expertise in designing and managing them.

## Answers Data-Architect Real Questions - Data-Architect Valid Test Guide

Pass4cram is one of the leading platforms that has been helping Salesforce Certified Data Architect (Data-Architect) exam candidates for many years. Over this long time period we have helped Data-Architect exam candidates in their preparation. They got help from Pass4cram Salesforce Certified Data Architect practice questions and easily got success in the final Data-Architect Certification Exam. You can also trust Pass4cram Data-Architect exam dumps and start preparation with complete peace of mind and satisfaction.

Salesforce Data-Architect Certification Exam is a proctored exam that is administered by Salesforce. Data-Architect exam consists of 60 multiple-choice questions that must be completed within 120 minutes. The passing score for the exam is 70%, and the exam fee is \$400. Candidates must possess a Salesforce Certified Data Architecture and Management Designer credential before attempting Data-Architect Exam.

### Salesforce Certified Data Architect Sample Questions (Q244-Q249):

#### NEW QUESTION # 244

Universal Containers has more than 10 million records in the Order\_c object. The query has timed out when running a bulk query. What should be considered to resolve query timeout?

- **A. PK Chunking**
- B. Streaming API
- C. Tooling API
- D. Metadata API

**Answer: A**

Explanation:

PK Chunking can resolve query timeout when running a bulk query on an object with more than 10 million records. PK Chunking is a feature of the Bulk API that splits a query into multiple batches based on the record IDs (primary keys) of the queried object. This can improve the query performance and avoid timeouts by reducing the number of records processed in each batch.

#### NEW QUESTION # 245

Universal Containers (UC) is a major supplier of office supplies. Some products are produced by UC and some by other manufacturers. Recently, a number of customers have complained that product descriptions on the invoices do not match the descriptions in the online catalog and on some of the order confirmations (e.g., "ballpoint pen" in the catalog and "pen" on the invoice, and item color labels are inconsistent: "what vs. "White" or "blk" vs. "Black"). All product data is consolidated in the company data warehouse and pushed to Salesforce to generate quotes and invoices. The online catalog and webshop is a Salesforce Customer Community solution. What is a correct technique UC should use to solve the data inconsistency?

- A. Add custom fields to the Product standard object in Salesforce to store data from the different source systems.
- B. Build Apex Triggers in Salesforce that ensure products have the correct names and labels after data is loaded into Salesforce.
- **C. Define a data taxonomy for product data and apply the taxonomy to the product data in the data warehouse.**
- D. Change integration to let product master systems update product data directly in Salesforce via the Salesforce API.

**Answer: C**

Explanation:

A correct technique UC should use to solve the data inconsistency is to define a data taxonomy for product data and apply the taxonomy to the product data in the data warehouse. A data taxonomy is a hierarchical classification of data entities and attributes that defines their meaning, format, and relationships. A data taxonomy can help ensure consistency, accuracy, and completeness of product data across different systems and channels.

### NEW QUESTION # 246

Ursa Major Solar's legacy system has a quarterly accounts receivable report that compiles data from the following:

- Accounts
- Contacts
- Opportunities
- Orders
- Order Line Items

Which issue will an architect have when implemented this in Salesforce?

- **A. Salesforce does NOT allow more than four objects in a single report type.**
- B. Salesforce does NOT support Orders or Order Line Items.
- C. A report CANNOT contain data from Accounts and Contacts.
- D. Custom report types CANNOT contain Opportunity data.

**Answer: A**

Explanation:

The issue that an architect will have when implementing the quarterly accounts receivable report in Salesforce is that Salesforce does not allow more than four objects in a single report type. A report type defines the set of records and fields available to a report based on the relationships between a primary object and up to four related objects. A report type has the following limitations: It cannot include more than four objects in a single report type, which means that the report cannot compile data from five objects (Accounts, Contacts, Opportunities, Orders, and Order Line Items) at once.

It cannot include objects that are more than two relationships away from each other, which means that the report cannot access fields from Order Line Items through Opportunities and Orders.

It cannot include objects that have a many-to-many relationship with each other, which means that the report cannot access fields from Contacts and Opportunities through the junction object Opportunity Contact Role.

### NEW QUESTION # 247

UC is having issues using Informatica Cloud Loader to export +10M Order records. Each Order record has 10 Order Line Items. What two steps can you take to help correct this? Choose two answers.

- A. Limit Batch to 10K records
- **B. Export in multiple batches**
- C. Export Bulk API in parallel mode
- **D. Use PK Chunking**

**Answer: B,D**

### NEW QUESTION # 248

UC developers have created a new lightning component that uses an Apex controller using a SOQL query to populate a custom list view. Users are complaining that the component often fails to load and returns a time- out error.

What tool should a data architect use to identify why the query is taking too long?

- A. Open a ticket with salesforce support to retrieve transaction logs to e analyzed for processing time.
- B. Use salesforce's query optimizer to analyze the query in the developer console.
- C. Use Splunk to query the system logs looking for transaction time and CPU usage.
- **D. Enable and use the query plan tool in the developer console.**

**Answer: D**

Explanation:

According to the Salesforce documentation <sup>1</sup>, the query plan tool is a tool that can be enabled and used in the developer console to analyze the performance of a SOQL query. The query plan tool shows the cost, cardinality, sObject type, and relative cost of each query plan that Salesforce considers for a query. The relative cost indicates how expensive a query plan is compared to the Force.com query optimizer threshold. A query plan with a relative cost above 1.0 is likely to cause a time-out error.

To identify why the query is taking too long, a data architect should use the query plan tool in the developer console (option B). This way, the data architect can see which query plan is chosen by Salesforce and how it affects the performance of the query. The data architect can also use the query plan tool to optimize the query by adding indexes, filters, or limits to reduce the cost and improve the efficiency of the query.

Using Splunk to query the system logs looking for transaction time and CPU usage (option A) is not a good solution, as it can be complex, costly, and difficult to integrate with Salesforce. It may also not provide enough information or insights to identify and optimize the query performance. Using Salesforce's query optimizer to analyze the query in the developer console (option C) is also not a good solution, as it is not a separate tool that can be used in the developer console. The query optimizer is a feature that runs automatically when a SOQL query is executed and chooses the best query plan based on various factors 2 .

Opening a ticket with Salesforce support to retrieve transaction logs to be analyzed for processing time (option D) is also not a good solution, as it can be time-consuming, dependent, and inefficient. It may also not provide enough information or insights to identify and optimize the query performance.
